great knowledge of what was required to make an all-electric house a successful proposition. The paper taught much, but it should be remembered that there was a great deal of difference between the conditions that governed the supply of cheap electricity in residential cities as compared with industrial districts. The author had condemned imitation, but he had not abandoned it entirely himself, for he still retained fireplaces in which to stand his radiators. It was not only wrong, but positively wicked to use a coal fire in a bedroom; a large proportion of fog was due to bedroom fires, because bedrooms being on upper floors, the chimney draught was very bad. The use of portable electric heaters enabled the heat to be directed just where it was re-

quired; they were ideal for bedroom use, and even in London were cheaper than the coal fire. By using a small radiator under the table one could work in a cold room very much more comfortably and efficiently than if other means of heating were used. He had tried to be fair in these matters—he had conferred with the gas people, and invented a coal fire himself which cost 2s. a week to run, and heated a 16-ft. room, the coal he used being the same as that burnt in power stations. It was all very well for the author to say that the Glasgow Corporation supplied him with electricity cheaply, but if 1,000 houses instead of one were supplied at those rates, the Glasgow accounts would undoubtedly show a loss.

Dr. S. Z. DE FERRANTI considered the subject was of immense importance to the community, and the outstanding feature of the paper was the faith of the author in his scheme. The equipment of his house would enable him to live with a very much greater degree of comfort than he could possibly do otherwise, but the greatest disadvantage was the lack of means of disposing of refuse; he had installed a destructor in his own house. After pointing out the advantages of radiant heat, he expressed the opinion that in a dwelling-house, anything which heated the air should be strictly avoided. A certain amount of cool air was necessary for the maintenance of good health. There was no question of loss of money in this matter; no matter how many houses were similarly equipped to the author's, the Glasgow Corporation would still want more. Mr. Mitchell knew what he was doing. Unfortunately electricity was dear in many places, due to poor load factor and the overrating of undertakings, &c. Hot water was a cheap method of storing energy at night, and development on some such lines would do much to solve their electrical troubles. The cost of £43 per annum mentioned by the author, paid Glasgow handsomely, and a similar service could not have been rendered by other means without costing several times that figure. A public supply of electricity was not available where he lived, and he therefore installed a crude-oil engine generating plant and batteries. The total load for the 27-roomed house was about 18 kW, and for some months now he had used no coal or gas whatever. The exhaust heat from the engine and that in the water jacket was stored for use in the house. Water pipes at a temperature of about 110 deg. F. embedded in the ceiling plaster, together with electric radiators, was the means of heating the principal rooms. The only combustion was in the cylinder of the engine, and the heat efficiency of such an installation was very high.

Miss A. E. HASLETT remarked that a feature of the author's house was its labour-saving qualities. She had been privileged to visit it, and the thing that surprised her most was the fact that when she was shown into the kitchen at the busiest time of the morning, she found the maid wearing headphones and sewing. Engineers were now coming into the home, and they would have to seek the woman's point of view before they got very far. Cheap domestic labour had gone for ever, and must be replaced by mechanical means, but the prevalent public idea that electricity was too dear and difficult to manage, must be corrected. Only the other day she was talking to a University educated woman who would be normally regarded as an intelligent person, but who was not aware of the fact that electricity produced heat as well as light. The success of electricity in the home would need a very much greater maintenance service than anything yet contemplated, and also regular inspection by persons who would take a real interest in the installation. The retention of the coal fire was merely a custom. The author had said a good deal about cheap electricity in Glasgow, and she would like to mention that in her own all-electric flat in St. Marylebone, she obtained her electricity for ½d. per kWh, light being a "gift," as was the case in the author's house. London was not so far behind as they had been led to believe. She thought it was about time that an electric kettle was produced which would heat water as quickly as it could be heated by gas.

Prof. A. H. BARKER could not agree with all the views that had been expressed. He would have liked the author to give more details about the size of windows, thickness of walls, &c., these having an important bearing on his heating scheme. The heating of water by electricity could only be advocated by a man who was so keen on the subject that he lost sight of the end. Apart from Dr. Ferranti's idea, which was attractive, it was impossible to get more than 20 per cent. heat efficiency in the house when electricity was used, whereas a much higher percentage was possible by other means, and the gas people were only destroying about half as much coal as the electricians.

Major E. O. HENRICI spoke from the point of view of the cost to the consumer, comparing his own house with that described in the paper. By using coal, gas, and electric lighting, his average cost for the last three years was £50 per year, but the installation was old and inefficient. It therefore seemed to be possible for electricity at ½d. per kWh to compete with other means of heating, but it would not be possible for him to dispense with one maid, even if he had an all-electric house. In his own house the cost would have been reduced considerably if a modern heater had been introduced; an electric heater was, however, three times as efficient because the heat could be used just where it was required. If the author's house had been built in his (the speaker's) district, the annual running cost would have been about £100.

Dr. MARGARET FISHENDEN said that in her own house, using gas and coal, the annual cost was £44, which indicated that electricity at ½d. per kWh could compete in ordinary houses; but it must be remembered that such houses were old, containing inefficient equipment. The author could have saved £9 per year if he had used an independent coke-fired boiler for water heating. She appreciated the value of radiant heat, but cold walls were by no means comfortable. She was very much surprised at the author's figures of the efficiency of electric boiling rings. The great discrepancy between his figures and those of manufacturers showed something to be wrong somewhere.

Mr. W. NOBBS explained that radiant heat from the sun could not be compared with that of a fire. The size of the sun and the angle of incidence were such that a person standing in sunlight was completely surrounded by warmth, whereas a fire (very much smaller and nearer) only directed heat on one spot. He had lived for about 15 years in houses warmed by convectors, with great comfort; radiant fires should only be used to supplement the former method. The creation of a night load by hot water storage only went part of the way. The wide fluctuations of the demand for water from day to day indicated that the average demand could only be efficiently met by electric heating at night.

Mr. L. J. GOOCH said that it had always been his ambition to live in an all-electric house, but the lack of an electric fire which could compare with a coal fire prevented many would-be users of electricity adopting such a scheme.

Dr. S. PARKER SMITH replied very briefly, and the President, on account of the shortness of time, asked intending speakers to send in their contributions for publication in the I.E.E. *Journal*.

New Electrical Proposals for Parliament to Consider.

WE publish below a list of proposals that will come forward in the next session of Parliament (1926). Readers who are desirous of obtaining further information will find the notices published in full in the *London Gazette* for November 20th, 24th, and 27th.

(a) Electric Light and Power.

Oldham Corporation.—Powers to extend the area of the borough so as to include the urban district of Chadderton and to extend the Corporation's limits for the supply of electricity so as to include the added area and to alter or repeal the powers of the Lancashire Electric Power Co. to supply electricity therein; further financial powers, &c.

Ascot District Gas and Electricity Co.—Authority to raise additional capital both for gas and electricity purposes, such capital to form part of the general capital of the company, &c.

Horley District Gas Co.—Powers to supply electricity in the parishes of Horley, Newdigate, Burstow, Horne, and Nutfield, and a portion of the parish of Charlwood in the rural district of Reigate, a portion of the parish of Upper Beeding, the parishes of Rusper and Crawley, in the rural district of Horsham, and a portion of the parish of Worth, in the rural district of East Grinstead.

Authority to erect a generating station, to manufacture and supply fittings, &c., to supply electricity in bulk, to change the name of the company; further financial powers, &c.

Leicestershire and Warwickshire Electric Power Co.—Further financial powers; provision for the conversion or division of the shares in the authorised capital of the company; authority to apply for special or other Orders under the Electricity (Supply) Acts, 1882 to 1922; removal of restrictions upon the placing by the company of electric lines above and below the surface of the ground; to provide that electricity supplied by the company within its area of supply to the owners, &c., of any railway, tramway, dock, harbour, and canal undertaking may be used for all or any purposes of any part of such undertaking whether within or without such area of supply, &c.

Milford Docks Co.—Authority to supply electricity to Milford Haven Urban District Council, to lessees and occupiers of property of the company, and to owners, lessees, and occupiers of adjacent property, &c.

Halifax Corporation.—Further powers in connection with the electricity undertaking; additional powers with reference to the tramway, trolley vehicle and omnibus undertakings; further financial powers, &c.

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—Powers to provide for the merger of the company and the sepearate undertaking of the company; to annul the resolution constituting the separate undertaking; to annul two agreements made between the company, the separate undertaking and the Halesowen Lighting and Traction Co., Ltd.; to vary the terms of the agreement of November 1st, 1922, made between the company and H.M. Treasury Commissioners; provision as to contracts and other instruments, &c., relating to the separate or the general undertaking; to annul

certain ordinary shares in the capital of the separate undertaking issued to the Halesowen Lighting and Traction Co., Ltd., and held by that company as nominees; to annul certain capital and borrowing powers of the separate undertaking; further financial powers, powers to relieve the company from the obligation to keep separate accounts of its undertakings, powers to invest in the shares, &c., of other companies and bodies; authority to manage the undertaking or generating stations of other undertakings; to extend the company's powers of selling or purchasing electricity in bulk and of laying electric lines for the purpose; powers to acquire by agreement the undertakings of other undertakers; to incorporate, repeal, and amend certain Acts, &c.

Metropolitan Electric Supply Supply Co., Ltd.—Powers to extend the area of supply as defined in the Metropolitan Electric Supply Co. (Various Powers) Act, 1905, as extended by the Metropolitan Electric Supply Co.'s Act, 1906, so as to include the following areas:—

In the County of Berks.—The county borough of Reading, the borough of Wokingham, the rural districts of Cookham, Easthampstead, and Wokingham, and parts of the rural district of Bradfield.

In the County of Bucks.—The rural district of Hambledon and parts of the rural district of Wycombe.

In the County of Oxford.—The borough of Henley-on-Thames, the urban district of Wheatley, the rural districts of Crowmarsh, Goring, and Henley, and parts of the rural districts of Culham, Headington, and Thame.

In the County of Southampton.—The boroughs of Aldershot and Basingstoke, the urban districts of Alton, Farnborough, and Fleet; the rural districts of Hartley Witney and Alton; and parts of the rural districts of Basingstoke and Petersfield.

In the County of Surrey.—The boroughs of Godalming, Guildford, Kingston-upon-Thames, Reigate, Richmond, and Wimbledon; the urban districts of Barnes, Caterham, Dorking, East and West Molesey, Epsom, Esher and the Dittons, Farnham, Frimley, Ham, Haslemere, Leatherhead, the Maldons and Coombe, Merton and Morden, Surbiton, Walton-upon-Thames, Weybridge, Windlesham, and Woking; the rural districts of Dorking, Farnham, Godstone, Guildford and Hambledon; and parts of the rural districts of Chertsey, Epsom, and Reigate.

Powers to supply electricity in bulk to local authorities, companies, bodies, or persons authorised to give a general supply of electricity within the area of supply comprised in the extension of districts above mentioned.

To authorise the company to supply electricity to persons requiring a supply for power within the added area and within the existing area, consisting of the district defined in the said Acts, which comprise the following:—

In the County of Berks.—The boroughs of Maidenhead and New Windsor and the rural district of Windsor.

In the County of Bucks.—The borough of Chepping Wycombe; the urban districts of Beaconsfield, Chesham, Eaton, Marlow, and Slough; the rural district of Eton and parts of the rural districts of Amersham and Wycombe.

In the County of Hertford.—The urban districts of Chorleywood and Rickmansworth and part of the rural district of Watford.

In the County of London.—The metropolitan boroughs of St. Marylebone, Hampstead, and Fulham.

In the County of Middlesex.—The boroughs of Acton and Ealing; the urban districts of Brentford, Chiswick, Feltham, Greenford, Hampton, Hampton Wick, Hanwell, Harrow-on-the-Hill, Hayes, Heston and Isleworth, Kingsbury, Ruislip-Northwood, Southall-Norwood, Staines, Sunbury-on-Thames, Teddington, Twickenham, Uxbridge, Wealdstone and Wembley, and the rural districts of Hendon, Staines, and Uxbridge.

In the County of Surrey.—The urban districts of Chertsey and Egham, and parts of the rural district of Chertsey.

Powers to make provision as to the purposes for which electricity supplied for power may be used, and for charging for electricity supplied under the intended Act. Powers to construct sub-stations; to constitute the company a power company; further powers as to the supply of electricity in bulk, &c.

London Power Co.—Power to construct a generating station on lands in the urban district of Heston and Isleworth for generating and transforming electricity, power to acquire land and erect and use electric lines, &c., within the borough of Richmond and in the urban districts of Brentford and Heston and Isleworth, to construct, place, and use electric lines and other apparatus for the transmission of electricity within the metropolitan boroughs of Fulham and Hammersmith and in the boroughs of Acton and Ealing and the urban districts of Brentford, Chiswick, Greenford, Hanwell, Heston and Isleworth and Willesden.

To make provision as to the application by the company for Orders under the Electricity (Supply) Acts, 1882-1922

Bristol Corporation.—Authority to use, for the purpose of a generating station, certain lands in the urban district of Portishead in the county of Somerset; to apply to the electricity undertaking of the Corporation the provisions of the Electric Lighting (Clauses) Act, 1899, in lieu of the provisions of the Bristol Electric Lighting Order, 1883; further powers in connection with the electricity undertaking; powers to extend the boundaries of the city and supply area so as to include part of the urban district of Portishead, in the county of Somerset, and of the parish of Henbury, in the rural district of Thornbury, in the county of Gloucester; other provisions, &c.

Hackney Borough Council.—Powers to construct in connection with the electricity undertaking an intake and screening chamber on the southern bank of the Hackney Cut navigation; to abstract water from the Hackney Cut navigation for condensing and other purposes; to apply some or all of the provisions of the Electric Lighting (Clauses) Act, 1899, to the electricity undertaking; further powers, including the construction of sub-stations under streets, the fitting-up of showrooms and offices, and the giving of demonstrations of electrical appliances; further powers, &c.

Guildford Corporation.—Further provisions with regard to the electricity undertaking, including the establishment of showrooms, &c., the allowance of discounts, &c., financial provisions, &c.

Mynyddislwyn Urban District Council.—Further provisions with reference to the electricity undertaking, &c.

(b) Electric Tramway, Motor-'bus and Trolley Vehicles.

Ramsbottom Urban District Council.—Powers to maintain and run motor omnibuses within and beyond the district; further provisions with regard to the existing tramway and trolley-car undertaking, including the increase of fares; further financial powers, &c.

Swindon Corporation.—Powers to run omnibuses within and beyond the borough; further powers with reference to the tramway undertaking; powers to extend the area of supply of electricity by the Corporation by the addition thereto of the parish of Rodbourne Cheney, in the rural district of Highworth, in the county of Wilts.; powers to provide showrooms, &c.; further financial powers.

Birkenhead Corporation.—Powers to run omnibuses within a radius of five miles from the Town Hall; further powers with reference to the tramway undertaking; additional financial provisions, &c.

Darwen Corporation.—Authority to construct new tramways, to provide and run trolley vehicles, to provide and run omnibuses within and outside the borough; further powers with reference to the tramways and electricity undertakings; additional financial powers, &c.

Doncaster Corporation.—Powers to provide and run trolley vehicles on certain routes; further powers with reference to the electricity undertaking, including the supply of electrical fittings.

Leicester Corporation.—Powers to construct and work certain new tramways; further provisions relative to existing tramways; further financial powers, &c.

Hartlepool Corporation.—Authority to equip and work trolley vehicles along certain routes; powers to abandon the tramways along these routes; authority to purchase from the West Hartlepool Corporation the overhead equipment and other works constructed in the borough by it under the provisions of the West Hartlepool Corporation (Trolley Vehicles) Order, 1925; further powers in connection with the running of trolley vehicles in substitution for tramcars; additional financial provisions.

Kidderminster and Stourport Electric Tramway Co.—Powers to construct new tramways and reconstruct certain existing tramways; powers to run omnibuses, &c.

Mexborough and Swinton Tramways.—Powers to provide and run trolley vehicles on certain additional routes; further provision with regard to the tramways and trolley vehicles, &c.

Rhondda Urban District Council.—Extension of time for the construction of tramways authorised by the Act of 1915.

East Ham Corporation.—Powers to run trolley vehicles within the borough; further provisions with regard to the tramway undertaking; additional provisions as to the supply of electricity and with regard to the electricity undertaking, including the establishment of showrooms, methods of charging, &c.

Colwyn Bay and Colwyn Urban District Council.—Powers to run omnibuses within the district; further powers with regard to the electricity undertaking.

Worcester Corporation.—Powers to acquire the existing tramways and light railways of the Worcester Electric Traction Co., Ltd., in the city, and to work the said tramways and light railways, &c.; authority to abandon and remove the said tramways and light railways, and to run trolley vehicles; powers to run trolley vehicles within and beyond the city; further provisions with regard to the tramways and light railways, &c.

Southend-on-Sea Corporation.—Powers to run trolley vehicles; further provisions with regard to the electricity undertaking, &c.

(c) Railways.

London Electric and Metropolitan District Railway Companies.—Powers to construct subways, improve, extend, and rebuild certain stations, &c.; extension of time limits for construction of certain railways authorised by the London Electric Railway Act, 1914; additional financial powers, &c.

Metropolitan Railway.—Powers to construct and work by electrical energy a railway in the urban district of Willesden and the metropolitan boroughs of Hampstead, Paddington, and St. Marylebone, &c.

Kearney High-Speed Tube Railway Co., Ltd.—Powers to construct a light railway in the county boroughs of Tynemouth and South Shields.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A Waste-Heat Boiler.

The present-day necessity for economy, particularly in the use of fuel, creates a favourable opportunity for the practical application of Dr. Nicolson's theories with regard to waste heat and gases to the design of boilers for utilising the heat in the flue gases from metallurgical furnaces, gas retorts, or from internal combustion engines. Such a boiler, made by Messrs. Joseph Adamson & Co., Hyde, Cheshire, is shown in fig. 1. It is designed with a view to the length and speed of travel of the hot gases across the heating surface exactly suiting the temperature and volume of the hot gases available, so that they will not leave the boiler at too high a temperature. It is of the flame tube type, constructed, it is claimed, in accordance with the best marine practice; the endplates are secured in the steam space by screwed bar stays of ample section and in the water space by special stay tubes, of thicker material than the others, screwed and expanded into both endplates. The feed water is controlled by a patent marine type regulator, which, it is claimed, will maintain the water level under widely varying load conditions. The heating surfaces

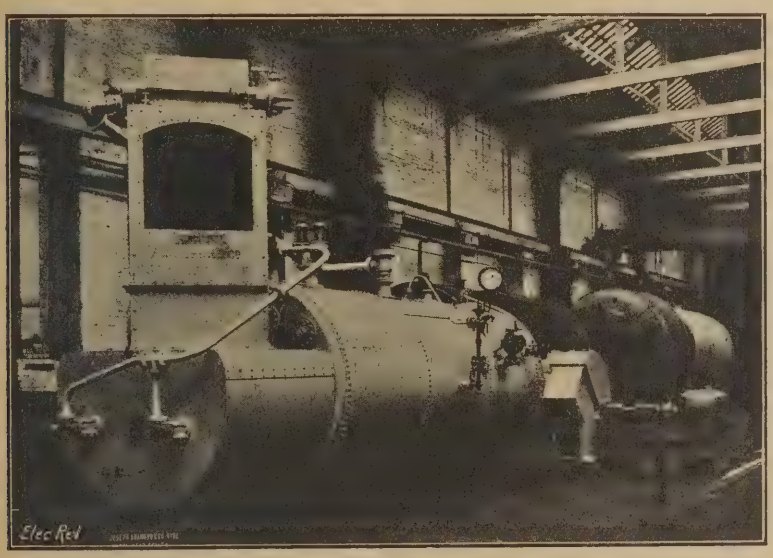

Fig. 1.—Waste-Heat Boiler.

are kept free from soot and other impurities carried in suspension by the gases, by the aid of a blower of the steam jet type, so arranged that all the tubes in the boiler are thoroughly scoured by a high-velocity jet of combined steam and flue gas. The working of the blower does not interfere with the normal

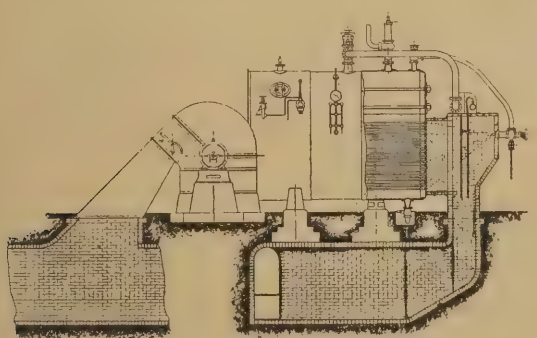

Fig. 2.—Method of Installation.

operation of the boiler, and the time occupied to clean a large boiler is only a few minutes.

It is estimated that a waste heat boiler on a soaking pit provides about 4,000 lb. of steam per hr., representing, say, 2,000 tons of coal saved per annum. The draught fan is electrically driven and for a boiler of this capacity a 20-h.p. motor is installed.

Fig. 2 shows the method of installation of the boiler with regard to the flues.

We suggest that such a boiler may meet the requirements necessary to make use of the waste heat from the small gas works in the country town, &c., for the generation of electricity. From the above estimated figures it may be assumed that a considerable plant for the generation of electricity could be adequately supplied with steam from such a source.

An Improved "Frog" for Overhead Trolleys.

A new design of overhead trolley "frog" has been recently introduced by the Westinghouse Electric & Manufacturing Co. of East Pittsburgh, U.S.A. In attempting to overcome the difficulties encountered in the use of the open-pan type of frog, many modifications of design have been introduced, some of which have operated effectively for trolleys working from the tangent to the curve, but have failed in the reverse direction, the wheel invariably leaving the frog due to the use of a 15 deg. angle. For perfect transition it was found that the correct angle was 8 deg., but such curves were found unsuitable in practice. It is claimed that the new design, which embodies a combination of the 8 deg. and the 12 deg. angles, permits of perfect transition from the tangent to the curve and *vice-versa*. One of its features is that the wheel flanges do not touch the pan, thus giving it a longer life. Flexible approaches are another feature, eliminating the hammer blow as the wheel approaches the body of the frog and doing away with the old method of holding the frog by the use of stove bolts. The bayonet approaches firmly hold the trolley wire, the sides of the approach interlocking with the prongs on the runner, and so providing a high safety factor and ease of installation.

A New Furnace Repair Gun.

The accompanying illustration, fig. 3, is of a new device in the form of a portable furnace repairing gun, which, according to *Combustion*, has been recently developed by the Quigley Furnace Specialties Co., Inc., for relining, patching, or surfacing furnace walls speedily and economically. Refractory materials of plastic consistency to conform with the best-known refractory practice of to-day in the maintenance of boiler and furnace walls are applied with the machine by means of compressed air. The pre-mixed material is placed in the gun; the nozzle is then pointed at the place to be repaired, and the mixture is forced through the hose and nozzle. A pressure of from 95 to 100 lb. is required for heavy plastic mixtures, and for thin mixtures it can be operated with a pressure of 50 lb. The gun consists of a cast-iron cylinder from which the material is forced by pressure applied to the piston. The material is placed in the gun at the charging opening A in the top. Pressure is applied at the bottom of the piston through the pipe connection F, and controlled by the valve B. As the piston rises, the mixture is forced into the Y connection C, from which point it is carried through the hose by pressure of the piston and through the valve D. The gun has a capacity of 2 cu. ft. of mixed material.

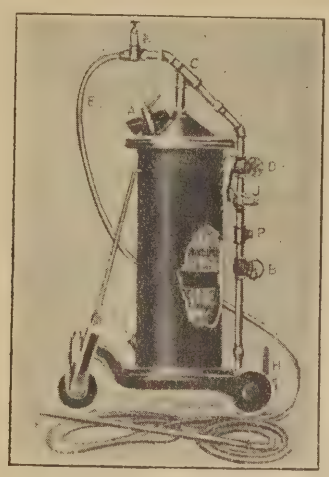

Fig. 3.—Furnace Repair Gun.

A Low-Loading Cable Trolley.

British Insulated & Helsby Cables, Ltd., has recently had constructed by Messrs. R. A. Dyson & Co., Ltd., Grafton Street, Liverpool, a trailer for the transportation of cable drums, a feature of which is that the frame level is only 5 in. from the ground, thus greatly facilitating the handling of the heavy drums. The trailer, which is of all-steel construction throughout, will be used in conjunction with a small tractor. The body which it carries is 8 ft. 2 in. long, the overall length being 10 ft. 6 in. and the width 3 ft. The axles are fitted with roller bearings and carry steel disk wheels fitted with rubber tires. Four vertical spiral springs are mounted on top of the solid axles in order effectively to damp out road shocks. The front axle is of the Ackerman steering type, and a locking arrangement is fitted in order that the trailer, which will carry loads up to 3 tons, can be reversed with ease and safety.

London's Electricity Supply in 1923-24.

The L.C.C. Annual Report.

The annual review of electricity supply in the London and Home Counties Electricity District for the year 1923-24, compiled by the London County Council,* is again replete with matter of the greatest interest and importance. In studying the report it has to be remembered that the year ends with March 31st, 1924, for local authorities and with December 31st, 1923, for companies; also that since the compilation of the report the Watford area has been excluded from the District. There is still another report to come before the record of the operation of the new Joint Electricity Authority commences.

The last census (1921) gave the population of the area as 8,168,819 in an extent of 1,797 square miles. Since the last returns the number of electricity supply authorities has been increased by one (the Chesham Electric Light & Power Co., Ltd., which commenced to supply in Amersham in September last) to 89. This gives the companies, 45 in number, a majority of one. The figures include three local authorities and one company (apparently that already mentioned) not actually giving a supply, and exclude one company (the Central Electric Supply Co., Ltd.), which is a bulk supply company only. The second part of the returns deals with bulk supply arrangements between various authorities. From this the authorities who had made agreements but had not exercised them appear to have been deleted. Apart from this the position appears to have been altered but little except that the total amount of energy interchanged increased by over 48 million kWh to about 201 million kWh. The North Metropolitan Company transferred its custom from the London Electric Railway Co. to Luton Corporation and took a larger quantity. The third section of the report merely shows the local government areas and the authorised distributors therein. The principal part of the report commences with Section 4, in which are tabulated the statistics relating to the capacity and output of all undertakings. A comparison with the previous report shows that the total capacity of generating plant installed at the end of the year rose from 675,532 kW to 758,477 kW—an increase of about 12.3 per cent. The capacity of local authorities' plant was 357,182 kW (14.7 per cent. increase), while that of the companies' plant rose by about 10 per cent. to 401,295 kW. At the same time transforming plant used in connection with bulk supplies increased by only 2 per cent. to 131,000 kW, there being a slight decrease in the amount of such plant employed by local authorities. The latter undertakers had a total of 215,510 consumers at the end of the year, as against 188,399 a year earlier, and the companies were supplying 225,757†, as compared with 219,401; so that the total number of consumers (subject to the proviso in the footnote) rose by about 8 per cent. to 441,267. The municipalities' maximum load was 236,756 kW and the average load factor 23.1 per cent., as compared with 204,432 kW and 22.5 per cent. in 1922-23. The equivalent figures for the companies were 313,512 kW and 20.3 per cent., as against 238,039 kW and 20.4 per cent. in the preceding year. The total maximum demand was thus 550,268 kW, as compared with 442,471 kW, and the overall load factor 21.6 per cent. as against 21.4 per cent. The kW equivalents of connections were as follows:—Municipalities: 1922-23, 586,790; 1923-24, 607,408. Companies: 1922-23, 691,988; 1923-24, 710,317.

Table 5 records the number of kWh generated, sold, &c., by each undertaking. The local authorities generated or purchased during the year (deducting intersales) 535,564,241 kWh, as compared with 449,684,678 kWh in 1922-23, while the companies' output rose from 479,127,973 kWh to 541,347,298 kWh; thus the total output rose from 928,812,651 kWh to 1,076,911,539 kWh. The sales closely followed the output, being 80 per cent. of the energy generated in the case of the local authorities, 79 per cent. in the case of the companies, and 79 per cent. overall; these figures remained stationary from the previous year.

Table 6 analyses the accounts of the undertakings in a very thorough manner. So far as the municipalities were concerned the total capital expenditure during the year was £1,453,659, bringing the total up to £17,936,726. The companies' capital expenditure rose by £1,906,839 to £26,253,452. It is interesting to compare the capital expended on buildings and plant with that employed for the purchase of cables and meters. In the case of the municipalities the respective amounts were £8,986,156 and £6,594,088; and with regard to the companies £14,535,404 and £10,786,253. Turning to the analysis of the trading accounts, it is seen that the municipalities recorded a total revenue from all sources of £4,202,706, as compared with £4,146,837 in 1922-23. The total of working expenses rose from £2,027,334 to £2,221,441. Thus the ratio of working expenses to receipts rose from 49 to 53 per cent. After meeting taxation and other expenses, the balance remaining to meet capital charges was £1,782,209 (as against £1,950,888). These charges amounted in the aggregate to £1,573,620 (£1,533,278), and the net profit was therefore £208,589 for the forty-four undertakings. A net contribution of £195,488 was made to rates. The companies' accounts show a total revenue of £6,127,194, an increase of £270,850, and working expenses totalling £2,433,369 (as against £2,465,868), reducing the ratio of expenses to revenue from 42 to 40 per cent. The amount remaining to meet capital charges, after deducting taxation, &c., was £3,728,939 (as compared with £3,212,113), and these charges, comprising interest, dividends, reserves, &c., aggregated £3,467,863† (£3,001,872*).

Table 7 sets out the average rates of interest and dividend paid by the sixteen companies operating in the County of London for each of the past 24 years. These figures show that the overall average rate fluctuated between the limits of 4.60 per cent. and 5.79 per cent. from 1900 to 1919; since the latter year the rates have been as follows:—1920, 6.02 per cent.; 1921, 6.22 per cent.; 1922, 7.10 per cent.; 1923, 8.07 per cent. In 1923 only three of the undertakings paid a lower rate than 6 per cent., *viz.*, the Charing Cross Co. (City Undertaking), 5.98 per cent.; the Kensington and Knightsbridge and Notting Hill Joint Station, 4 per cent. (a fixed dividend); and the Central Co., 4.91 per cent. Five undertakings distributed over 10 per cent., *viz.*, the Brompton and Kensington Co., 12.94 per cent.; the Notting Hill Co., 16.08 per cent.; the St. James' and Pall Mall Co., 10.50 per cent.; the South London Corporation, 11.26 per cent.; and the Westminster E.S. Corporation, 10.58 per cent. Statement 8 shows that the London companies had realised premiums totalling £963,022 upon the issue of new capital up to the end of 1923; the bulk of this (£674,226) was transferred to renewal, reserve, &c., funds.

Table 9 is a statement of the capital expenditure of the London undertakings (company and municipal) during each of the six years ended with the period under review, *i.e.*, from 1918-19 to 1923-24. In the case of the municipalities the expenditure for the six years totalled £11,472,164, and that of the last year £1,076,129. The companies expended £20,989,502 in the six-year period and £1,838,797 in 1923.

In statement 10 these London authorities are set out, irrespective of the class to which they belong, in order of age, to show what provision has been made for depreciation or its equivalent. The net expenditure charged to capital account is shown, and this is followed by statistics of charges met out of revenue or premiums, the writing-off of preliminary expenses, &c., the totals of various reserve funds, and the repayment or provision for repayment of loans. Among the outstanding items in this section are the following:—The County of London Co., which with a net capital expenditure of £3,072,167 has a total of the other items mentioned above of £1,702,151; the Metropolitan Co. shows a net expenditure of £3,008,188, and a total of reserves, &c., of £1,905,698; the City of London Co. has a net expenditure of £2,783,072, the other items totalling £1,615,419; the Woolwich Borough Council has been aided by the rates to the extent of £253,809; for the Hampstead Borough Council a net expenditure of £349,367 is shown, while the total before-mentioned is £551,121. The latter amount includes £236,218 applied to replacements or purposes of a capital nature, and £276,056 repayment of loans (including provision for this). The operations of refuse-destructor undertakings are dealt with in Table 11. There are six of these and details for Fulham, Hackney, Poplar, Shoreditch, and Stoke Newington are given. For the Woolwich undertaking no figures were available. Full particulars are given only in the cases of Poplar, Shoreditch, and Stoke Newington, and it is shown that these three undertakings generated 1,213,656 kWh, 319,470 kWh, and 246,698 kWh respectively, and charged 0.378d., 0.461d., and 0.240d. per kWh.

The financial results of each of the undertakings belonging to metropolitan borough councils from its inception to March 31st, 1923, are detailed in Table 12. There are 16 undertakings in the list and of these three (Bermondsey, Southwark, and Woolwich) show a deficit over the period of their existence. The remainder show aggregated profits of various dimensions and the net result of the whole 16 is a profit balance of £493,396. The net contribution to the rates has been £134,991.

(To be continued.)

† Incomplete totals.

Electrical Developments in Switzerland.—In this country of "white coal" the use of electrical energy continues to increase, and a whole series of power stations have either been or are being erected or enlarged, involving the expenditure of many millions of francs. At Waggital the plant was to be extended by about 162,500 h.p., while a 10,000-h.p. plant was to be installed at Klosters and linked up with the power stations in the Grisons. In the canton of Valais, two stations at Oberems and Tourtemagne were to be established to produce 30,000 h.p. The Martigny-Orsières is constructing a station at Orsières with an output of 30,000 h.p., and the power houses at Chancy-Pougny will furnish 29,000 h.p. In German-Switzerland fresh stations are about to be built at Sufers-Andeer, the favourite summer resort Andeer-Sils, on the Upper Rhine at Niederschworstadt, Dogern and Reckingen; and at Ruperswil, Wildegg-Brougg and Bottstein, as well as other stations in the Rhone basin.

The North Wales Dam Burst.

Report of the Coroner's Inquest.

ON December 1st the inquest conducted by Mr. J. P. Williams, Coroner for North Carnarvonshire, on 11 of the 16 lives lost due to the breakdown of the dam at Lake Eigiau on November 2nd, was concluded. Mr. W. Proctor represented the Aluminium Corporation, Ltd., and Mr. E. W. Hudson the Electricity Commissioners and other Government Departments.

Mr. RALPH FREEMAN, a partner in the firm of Sir Douglas Fox and Partners, consulting engineers, gave evidence that the dam was constructed in two sections. The first section was built in 1907-8, by the executive engineers, Messrs. Harper Brothers, in conjunction with his firm as consulting engineers, the contractors being Messrs. Bott & Stennett, a firm which no longer existed. The work was suspended for two years, after which his own firm acted alone as consulting engineers for the completion of the dam. The break took place at the extreme end of the first section, built by the first Aluminium Corporation. The dam was built on hard blue clay containing granite boulders, overlaid by two or three feet of peat. The dam was a concrete wall, L-shaped in plan, and the break occurred on the long leg at a point where the greatest pressure was not met with, nor was it the weakest part of the dam; at this place the plans showed that the depth of the wall was 26 feet. Mr. Owen was resident engineer for his firm during the second stage of the work in 1910-11.

In reply to the Coroner, witness said that in his opinion a dam founded six or seven feet deep in the clay was a perfectly reliable structure. There must have been some latent defect. He had frequently visited the dam, which had not been structurally altered, nor had the water level been raised. When the burst took place a section of the clay, about 60 ft. long and 12 ft. deep, was removed from under the foundations, leaving the wall intact. Measurements that he had made since the break showed that at one end the dam was carried only 1 ft. 6 in. into the clay, and at the other end 6 ft. According to the drawings the bases should have been at the same level. This year had been the driest recorded since the dam was finished, and during the summer the lake was empty; the exposure might have dried the clay sufficiently to allow of leakage under the foundations. Leakages in the face of the dam had nothing to do with the break. The dam of the small lake Coedty above Dolgarrog, which received the escaping water, could not possibly withstand the discharge of 100 million cubic feet of water from a height of hundreds of feet.

Mr. J. ROBERTS, of Bangor, who was interested in the formation of the original company, said it was known that the dam had been leaking for some time, and the concrete used in its construction was very poor. He had seen leakages there in 1923.

Mr. A. E. JONES, watchman at the lake, said he reported a leakage near the place of the breakage early in the summer, and it was satisfactorily repaired. On the night of the disaster, November 2nd, he noticed water flowing through the wall and rang up the works at Dolgarrog; he was told to hold on the line by the person who answered the telephone, as he was speaking to someone else, and before he could deliver the message the line was broken. He then telephoned to the watchman at Lake Cowlyd and asked him to inform Dolgarrog that the dam had burst.

Mr. CROSSLEY COLLY, constructional manager to the Aluminium Corporation, gave evidence regarding work done on the dam, and said there had been leakages through it, the concrete being very porous, but no leakages under the dam had been recorded. The dam was 4,600 ft. long, of which 3,300 ft. was concrete and the rest peat bank, at the shallow end. The capacity of the reservoir above the normal level of the lake was 160 million cubic feet. It was the duty of the water supervisor to inspect the whole of the hydraulic works once a week; there was a man resident at the lake who operated the sluice-gate, and kept an eye on the works. Cracks in the dam were plastered in 1921, and grouted under pressure in 1922. During the last three years repairs were carried out on both legs of the dam, the upper face being coated with concrete. There was never any sign of water going under the dam. The two telephone lines from Eigiau and Cowlyd converged near the power station, and the former was swept away by the flood; in future it would be advisable to put the lines on higher ground.

Police-constable JONES, who was formerly a stone mason, said the part of the dam left standing over the gap had since fallen in, and he observed that the concrete was not properly mixed. During the past two years he had seen the water ankle deep across the road opposite the gap, and the place was a swamp.

Mr. A. A. HARPER, of Messrs. Harper Brothers & Co., said that his firm was responsible for the construction of part of the dam. According to the last progress sheet, issued on October 9th, 1908, the plans showed that 100 ft. of concrete had been made which had never been certified, and for it his firm was not responsible. The break took place from the point where they finished. The man in charge of the work, named Wilson, was now dead.

The witness was examined by Mr. W. PROCTOR, and admitted that a contemporary plan signed by his firm's engineer showed that the place of the fracture was within the portion constructed when Harper Brothers were alone the engineers for the reservoir. His firm never completed the contracts of 1907-1908, and was not paid for the last section of the work done, which was never certified.

Mr. L. P. D. TAYLOR, the engineer referred to by the last witness, said that his headquarters were at Dolgarrog and the work at Eigiau was under the supervision of Wilson, a reliable man who was then about 65 years of age, as clerk of works, who was responsible for the mixing of the concrete. The discrepancy between the depth of the concrete wall at the place of the fracture as shown on the plans (26 ft.) and the actual depth (20 ft. 6 in.) must have been due to negligence on the part of Wilson. Harper Brothers were the executive engineers.

Mr. J. L. OWEN said that he made the survey for the original promoters, and from the time he came into the matter for Sir Douglas Fox & Partners the foundations, to his own knowledge, were of the proper depth.

Mr. E. D. HUMPHREYS, water supervisor to the Aluminium Corporation until July last, said he reported leakages in the dam near the spot where it gave way; they all came through the concrete. A weekly report was made to the head office, and any leaks were attended to.

The CORONER, summing up to the jury, said it was clear that where the dam broke the work was not properly done; the foundations were not carried deep enough. "It was a case of accident, but undoubtedly there had been gross neglect, really criminal neglect, on the part of somebody, but unfortunately they did not know at this distance of time who was responsible."

The jury returned a verdict of "Accidental death, caused by the bursting of the Eigiau dam, and on the evidence a section of the wall lacked proper foundations." They recommended that dams should be subject to Government inspection.

For the foregoing report we are indebted to the daily Press, particularly *The Times* and the *Manchester Guardian*. Particulars and illustrations of the dam were given in the ELECTRICAL REVIEW of November 13th, p. 772.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

Lighting of Parliament.—On November 30th, Mr. BARNES asked the Under-Secretary of State for the Home Department, as representing the First Commissioner of Works, whether the electric lighting installation throughout the Parliamentary buildings was the most economical and up-to-date.

Mr. LOCKER-LAMPSON said that the electric lighting installation of the Houses of Parliament was not the most up-to-date, but was generally satisfactory, and was run as economically as possible. The whole building was being re-wired gradually in order to bring it up to modern standards.

P.O. Switchboards. — On December 1st, Sir W. MITCHELL-THOMSON informed Mr. DAY that the Post Office had not ordered switchboards from Germany, nor obtained a tender for them from that or any other foreign country.

The Broadcasting Committee.—On December 1st, Sir W. MITCHELL-THOMSON informed Mr. CAMPBELL that the Broadcasting Committee would decide in due course whether it should issue any interim report and whether it should recommend the publication of evidence.

The Weir Report.—On December 2nd, Mr. BALDWIN informed Mr. T. THOMSON that it was not proposed to publish the Weir report on electrical development.

Report of Smoke Abatement League.—It is interesting to note in the 6th annual report of the Smoke Abatement League (1924-5), that satisfactory arrangements have been made to hold a "Universal Smoke Abatement Exhibition" in Bingley Hall, Birmingham, in September, 1926. The League has been engaged in adding continuously to its exhibits for use in connection with Health Weeks, &c., and many designs of exhibits, other than photographs, have been prepared. Arrangements have also been made with Messrs. Ernest Benn, Ltd., to publish a small handbook dealing with domestic smoke. This will be composed of contributions by various experts, and is intended to assist householders, builders and architects in connection with the reduction or elimination of domestic smoke. A book or series of books dealing with industrial smoke and noxious fumes is contemplated, and a pamphlet dealing with the effect of smoke on health is in course of preparation, and, it is hoped, will be published early in 1926. A forty-eight page pamphlet entitled: "Smoke Abatement in Salt Lake City, Utah," has also been published by the League with the kind permission of the Salt Lake City Engineering Department. The body has in active formation a library of books, pamphlets, &c., dealing with every aspect of smoke abatement and allied subjects, and it is hoped to develop the library for loan purposes to members. There were on September 30th thirty-nine local authorities affiliated to the League, some of which have appointed members to its Council. The League is striving its utmost to carry out its aims and ideals, but is hampered by lack of means. The statement of accounts for the year in question shows a deficiency of £289, which is the result of this year's Smoke Conference at Manchester. The subscriptions received by the League amounted to £256.

Correspondence.

Discussions at the Institution of Electrical Engineers.

I think some protest should be made against the cutting short of the I.E.E. meetings precisely at 8 o'clock, no matter whether the discussion is complete or not, and even to the extent of instructing the author that he is not to make a verbal reply.

I was delighted to note that Dr. Smith on Thursday ignored this and gave a partial reply in acknowledging the vote of thanks. It is sincerely to be trusted that this will become the usual practice.

If it is essential that the President and Council should leave promptly at 8 o'clock, would it not be possible to appoint an acting chairman in cases where it shows signs of being worth while? Some member of standing could always be found among the audience who would be willing to take on this function.

I must say that for my part I regret the old days in which it was possible to have a really free and frank discussion.

F. Creedy.

London, *December 5th*, 1925.

As an Associate Member of the Institution of Electrical Engineers who has taken a keen interest in the progress of the Institution for a number of years, I note with great regret the very bad practice which appears to be growing, of stifling discussions at ordinary meetings, and closing the meeting, no matter what stage has been reached, so as to finish before 8 p.m.

This has been very noticeable during the last year or so. I know that several members considered this custom had reached a climax at the last meeting, when after Dr. S. P. Smith had given an excellent paper on a subject of the widest possible interest and a good discussion was developing, the meeting was curtly cut short, and the apparent discourtesy done Dr. Smith of attempting to deny him the opportunity of making even the briefest reply. To the great satisfaction of many of us he ignored this unfortunate, and, maybe, quite unintentional act and made a brief reply on general lines.

It is high time, if the Institution is to succeed in maintaining the supply of valuable papers for discussion, that members who give their time to the preparing and delivery of papers should at least be given the fullest opportunity for proper discussion of their work and for making an adequate reply.

The time at present allowed reduces the whole thing to a farce.

In conclusion, may I suggest that the Member, President or otherwise, who presides at ordinary meetings should, in all cases, be prepared to continue the meeting till 9 o'clock or even later, if it is the wish of the meeting, and that the Council dinner be held on some other evening, or that a supper at a later hour be substituted. Then perhaps the restive spirit which reveals itself as 8 o'clock approaches may be countered.

In all seriousness something should be done at once to get back to the really unfettered discussions which we used to have in the past.

May I add, I make this appeal as a listener and not as a would-be speaker.

A.M.I.E.E.

Westminster, *December 5th*, 1925.

The Metering of Three-phase Power.

In reply to "A Meter Superintendent's" letter appearing in your columns, I regret to say that I am not able to give very much *useful* information concerning the error of 15 per cent. which I mentioned as having occurred in a three-phase, four-wire meter of the two-element type. This case came to my notice in an engineering works where the load consisted of induction motors and single-phase welding plant. Condensers were also installed for the improvement of power factor. A three-phase, four-wire low-pressure supply was given to the consumer, and a two-element meter with its three current transformers connected in delta was installed to meter it. The consumer had a meter of the three-element type installed to check that of the supply undertaking, and it was noticed that this meter almost always registered apparently fast. The supply undertakers re-tested their own meter in their test department, and under the usual conditions of test to which a meter of this type is subjected, it was found to be accurate.

Doubts as to the accuracy of the customer's meter then existed, and I therefore conducted tests at his works, but only to find his meter accurate also. At my suggestion, the supply undertaking then installed three single-phase check meters, and the 15 per cent. error which I quoted was the result of the readings between these three single-phase meters and the two-element polyphase meter. Tests were afterwards made by the supply undertaking to ascertain exactly the type of load at this works, but as I was not directly concerned, I regret to say that I have no actual figures of the results obtained.

I am pleased to note that your correspondent and also Mr. Malcolm agree that three separate metering elements are desirable for the correct metering of a three-phase, four-wire supply. Whether three separate single-phase meters or one three-element polyphase meter is employed it matters not, as the results in either case will be correct for *any* condition of load.

Regarding the points which are mentioned as preventing the adoption of the three-element polyphase meter, the subject of cost is, without doubt, an important one. Whilst I admit that a five-ampere, three-element meter is slightly more costly (a matter of shillings) than one having only two elements, it should be borne in mind that usually these meters are used in conjunction with current transformers, and the extra cost for a three-element meter is then very small compared with the cost of the complete equipment.

In any case, it is my opinion that this extra cost is worth while, seeing that a meter which will register accurately under all conditions of load is obtained.

The subject of errors caused by interaction between the elements is one in which I'm afraid I am not in agreement with "A Meter Superintendent." Does he just conclude that errors of this kind occur in three-element meters, or has he any figures that he can give us on the subject? My experience is that with a properly-constructed and calibrated meter errors caused by interaction are so small that they can be neglected.

I regret to note that "A Meter Superintendent" does not think I give the meter engineer the credit due to him. That is quite contrary to my wishes. There are, without doubt, many very capable meter engineers engaged in the supply undertakings in this country, and where they are allowed to exercise their capabilities very little, if any, bad metering is to be seen. No doubt "A Meter Superintendent" is one in this fortunate position, but he should remember that the position the meter superintendent is a "minus quantity" in many of the supply undertakings, and that often when a capable man is employed he is restricted in his work and not allowed to decide on the systems of metering to be used.

I shall be interested to read the results of Mr. Malcolm's suggested experiments. The subject of maximum-demand indicators I will deal with at a later date, as I feel I have already trespassed too far on your valuable space.

H. Hugh Jaques.

London, *December 5th*, 1925.

The Salaries of Combustion Engineers.

I am afraid that the letter signed "Shift Engineer," expressing astonishment at my comments on the above subject, and, presumably, your own unqualified endorsement thereof, seems only to emphasise what I wrote. I do not for an instant belittle the rank of shift engineer, having been one myself for many years, but what I wished to emphasise was that, as in the instance given by "Shift Engineer," what constitutes a fully qualified combustion engineer does not appear to be very widely understood on this side of the Atlantic.

While the only positions open for specially trained men, of whom the specialising shift engineer is usually the best type, are of the order "Shift Engineer" has for a subordinate, there will be no encouragement for men to become specialists at all.

All engineers who keep themselves abreast of the times realise that the boiler house is nowadays the place of primary importance in view of the imperative need to keep coal costs down to a minimum, and requires infinitely more constant and careful supervision to this end than any other portion of the plant. In a case like that of your correspondent, although he is nominally responsible for the boiler-house efficiency, it is the man on the spot who actually controls this, not the one whose other duties do not permit him to do so.

It is idle to argue in these times that a man can be a first-class all-round engineer and at the same time a specialist in a particularly involved branch of engineering; whichever he gives his mind to properly, the other is bound to suffer.

Chas. F. Wade.

Sheffield, *December 4th*, 1925.

I have read with interest the correspondence on the above subject appearing in your issues of November 27th and December 4th.

In the quite early stages of my power station experience, covering as it has done the control of the combustion of, I suppose, about 3½ million tons of fuel, I was led to the inevitable conclusion that the resident engineer must, personally, give a large proportion of his time to the solution of problems pertaining to the combustion of fuel, for the very good reason that 75 per cent. to 80 per cent. of the total cost of generating electricity is due to the cost of the fuel burnt.

The efficiency of the turbine house is settled, within small limits, by the type and design of prime mover installed. It is to the boiler house with its varied problems in mind and matter that his attention must perforce be directed if he be determined to obtain true commercial efficiency. A decrease of 5 per cent. in the amount of coal consumed—quite a possibility in many stations, even in 1925—ensures a decrease of about 3¾ per cent. to 4 per cent. in the cost per kWh.

The class of grate installed, the extent to which forced and/or induced draught is available, the facilities for bunkering fuel and for disposing of ashes—in short the conditions generally—determine the classes of coal which may be burnt with hope of success. The more elastic and complete the control over the combustion chamber the wider becomes the market for fuel. A wider market tends to extract lower offers from colliery or merchant. Therefore not only must such fuel as is purchased be properly burnt, but the limitations found and the possibilities detected in the actual combustion of the many kinds of fuel purchased must be fully known or communicated to the purchaser—usually the resident engineer.

In relatively small stations I have found that the best commercial results may be obtained by each charge shift engineer undertaking the combustion work on his own shift, giving 50 per cent. to 75 per cent. of his time to it, so long as he keeps in close touch with his chief, the latter settling the thickness of fire, speed of grate, and the best draught conditions determined by trial made in closely reasoned co-operation with his three engineers on shift. Such an arrangement has the advantage of creating friendly shift rivalry provided the coal can be weighed and the *personnel* of the shift remains reasonably constant—the latter a thing of the past with the introduction of the 48 hours' week.

If, however, the station is a large one this close co-operation is not possible to the same degree in the same way. It then becomes necessary that more of the charge shift engineer's time shall be directed to the general supervision of the station as a whole, thus diverting seriously the needed constant attention to combustion details. The resident engineer in the same way finds himself drawn little by little from this important branch of his care, by wider or more immediate issues such as extension of plant, or labour troubles, threatened or actual, Hence he must engage as a right-hand man, either in the person of a chief assistant or a thoroughly sound combustion engineer, someone who can form a reliable link between himself and the boiler house. This man will, depending on the size of the plant, together with the facilities and degree of control given him, either himself direct during the day the operations of the leading stokers, setting the conditions of combustion; or, alternatively, exercise control through the medium of junior combustion engineers on shift. At the same time he will keep his chief fully informed of results, and possibilities of improvement, obtaining consent to likely improvements and carrying them out.

I am afraid no hard and fast lines can be laid down as to when in the life of a growing station the appointment of a combustion engineer becomes a paying proposition; but that a qualified combustion engineer is a very pressing need in a well-run super-power-station cannot be gainsaid. Within the limits of commercial efficiency such a man can, if he be technically proficient, patient, resourceful, of sound character and endowed with a capacity for team work, command, and will be gladly paid, a good salary.

In a power station burning 200,000 tons of coal per annum costing 10s. per ton, a saving of £1,000 a year is effected for every 1 per cent. decrease in the coal bill. But even if we assume that following the appointment of a combustion engineer such a result was obtained, the benefit derived could not be credited wholly to his endeavours. Some credit is due surely to capital for the venture made (he might turn out a "rotter") and facilities given; more is due to the customer, and more again to the loyalty and co-operation of his fellow officers and workers. A fair figure would probably be one-third or, say, £330.

Having determined roughly the salary he could offer, due regard being given to the improvement in efficiency possible, it would, in my view, be the duty of the resident engineer in the interests of true commercial efficiency—or what may be described as a fair deal by one's staff and undertaking, one's customers and one's country—to obtain the best man at the lowest figure he can. The value to be placed on the services of such a man depends, naturally, on the number of equally good men desiring the post and the number of positions vacant.

E. W. Dickinson.

London, *December 5th*, 1925.

Rural Electricity Supply.

May I contribute to your highly esteemed journal a few remarks on the above subject, which is of much interest to-day and of which I have had about 35 years' experience.

A public supply of electricity is a benefit to all, even indirectly to those who do not themselves require a supply. Therefore to charge a rental because a pole is placed upon or because wires cross over property is selfish and unneighbourly.

I have considered and treated the matter as follows:—

In asking permission to erect a pole or attach to a chimney or cross over property, it has been on the grounds that it is first a public utility, secondly an advantage to the property owner. This second reason is explained by the statement that mains will be erected in the vicinity and if the wayleave is granted a supply of electricity will be available in the future with only the small cost of the covered wire service which is part of the wiring installation, but if consent is refused the future consumer will have to pay for an extension to the property.

To avoid a "right of way" a letter was written in each case to the owner undertaking to "make good any damage and to remove the wires at any time upon receiving three months' notice to do so." This undertaking may seem a risky condition to promise, but it has been very seldom exercised, while it gives the property owner a sense of security in the event of alteration to property or change of ownership.

Many thousands of wayleaves have been granted without any payment at all, and after the district has been well covered with supply wires, generally at the backs of the houses, then in case it is necessary to remove in one case it is easy to cut out a section and feed round. If a rental is insisted on, then the rent should be debited against the supply when required—and one may rest assured that it will be required much sooner than the owner thinks.

The getting of wayleaves is a personal matter, and the district manager may leave or die or some adverse influence may create apprehension or distrust among the owners; to avoid this and for other reasons it is advisable to form what I called "District Advisory Committees."

The District Advisory Committees consisted of members nominated by the Corporation or Urban District Council and/or by the Rural District Councils, power users, domestic users, and the supply company, with the district manager; a secretary was provided by the supply company. The Committees had no executive powers, but with their local knowledge and interests were most useful in influencing troublesome wayleaves as well as in other matters.

In all cases of a continuing business, such as electricity supply is, I consider it advisable to earn only moderate profits and the paying of dividends somewhat in relation to the cost of money, especially so where the public are *giving* facilities and their interests are the interest of the business.

Before the war dividends in no case exceeded 5 per cent.; indeed, from 1905 to 1913 a steady 5 per cent. was paid, the balance between earnings and distribution being utilised for renewals and improvement of plant. Larger dividends have been paid since the war, but then the value of money has decreased.

The price to be charged for energy is another matter that requires to be in accordance with public ideas, and in this respect the District Advisory Committees were a useful medium to correlate the ideas of consumers and suppliers—a matter also relative to free wayleaves, but which I will not pursue further in this letter.

Napier Prentice.

Stowmarket, *December 4th*, 1925.

A Grumble.

May I get a small grumble off my chest suitable for the Christmas season? Like many others, I find my time so occupied that I have great difficulty in reading the technical Press. To make matters worse, the "E.R." is becoming fuller and more interesting all the time: even the advertisements clamour to be read. How is one to get the time to absorb the ever-increasing mass of knowledge?

Overtime.

December 4th, 1925.

[Our sympathies are with our correspondent; the flood of information that reaches us, both in print and in MS, in these stirring times is almost incredible, and quite beyond the power of the individual to assimilate. But though we dwell in a land overflowing with intellectual milk and honey, we are not compelled to overeat. Let us be content to select a mental diet which shall afford variety and stimulate thought, without tending either to excess or to scantiness—and leave the rest.—EDS. ELEC. REV.]

Assisted Wiring Schemes.

The full account you gave in your issue of the 27th ult. of Mr. Edgar's paper on "Assisted Wiring," which he read before the recent E.D.A. Conference, has confirmed a statement that he made which I was unable to appreciate at the time, and would anyhow have been unable to mention at the meeting, as it was contained in his reply to the discussion.

In reply to the criticism by Mr. Abbott, Mr. Edgar stated "that he did not consider that the cost per kWh should include capital charges on the generating plant, because the generating plant was already there, and there must be sufficient overload capacity, or stand-by plant, to meet all the load that would arise from these comparatively small consumers for some time to come." These capital charges, or at any rate a proportion of them, are invariably charged to the domestic consumer, but Mr. Edgar in his anxiety to attract the small domestic consumers, lets them off their share of the capital charges, and therefore presumably sells them lighting units at a cheaper rate than to other domestic consumers.

As a statutory undertaker Mr. Edgar is surely contravening the Electricity Act of 1880, which states that "no undue preference shall be given to any consumer," and his concession seems unfair to the other domestic consumers who, as Mr. Edgar indirectly admits, have financed his assisted-wiring scheme. Taking the figures given for the estimated number of consumers under this scheme by March 31st next, namely, 6,000, and allowing, say, an average maximum demand of 100 watts per consumer, we get a total maximum demand of 600 kilowatts or, say, 400 kilowatts on the station allowing for diversity. This may be insignificant in comparison with the total maximum demand of the South Shields undertaking, but it may be appreciable if the rate of connection under his scheme is maintained, and at any rate it brings nearer the time when fresh plant will have to be installed.

With the exception of this one point this scheme seems admirable, nor would it to my mind have been less successful if the proper proportion of capital charges had been added to the unit charge, though in a small undertaking, as Mr. Abbott pointed out, these capital charges are the chief item in the cost of the lighting unit.

It is to be hoped that the E.D.A. will follow up the suggestion made that it should collect and publish details of other schemes in order to help the supply industry in its ultimate aim and purpose, namely, "to sell electricity."

J. N. R. Perks.

London, *November 30th*, 1925.

Overhead Distribution.

I read with interest your article on the electric supply to Brundall, and afterwards went to have a look at the village.

While acknowledging with gratitude that the company, to avoid damage, has done what was possible by varying the lengths of the poles and by making many diversions and crossings, I cannot share your hope that compulsory powers may be obtained for the uglification of similar tree-shaded villages. My sympathies are all with the recalcitrant frontagers—and with the trees.

A money value cannot be put on æsthetic damage, but even regarding the matter from the lowest standpoint (*i.e.*, financial), I suggest that Brundall has made a mistake in allowing a pole line through the village street. The district is practically a residential suburb of Norwich, and the householders are nearly all of a good class of people who have taken some trouble to get away from the town into a pleasant country neighbourhood. Though there is no doubt of their appreciation of electricity for similar prospective owners, a system of distribution which would look ugly in the outskirts of Manchester can hardly be classed as an attraction.

The Norwich Corporation is delivering about six miles from its generating station, and the last three miles or so are through open country. It has been able to run underground all the way, so it is difficult to see how another two miles of underground distribution could have added a prohibitive percentage to the cost.

Sometimes in recent years when repassing through a village one has wondered why it looks so much nicer, and it comes rather as a shock to realise that since the last visit the Post Office trunk line which one had regarded as a permanent feature, has been put underground. It would be a great pity if, in the name of progress, supply companies should work in the opposite direction, and give us an even worse set of eye-sores to get used to.

I should not have troubled you now, if this article had not followed a long series of advertisements showing for example a charming stretch of Welsh hills or a corner of a village in Hampshire, with the only blot on the landscape "featured" as the point of the advertisement. The force of reiteration is strong, and if nobody protests we engineers will begin to imagine that a pole-line is beautiful and that those who put it up deserve well of the community.

S. E. Glendenning, M.I.E.E.

Norwich, *December 5th*, 1925.

Trade-mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from December 2nd. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Prt (lettering and design). No. 463,438. Class 5. Copper, brass, bronze, aluminium, and German silver wires. No. 463,439. Class 8. Copper, bare or tinned bronze, and aluminium electric cables.—Cie. Générale d'Electricité, Paris. (Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

M.W.L., My-Lite The Sign (lettering and design). No. 460,329. Class 8. Electric cells and batteries (not for medical purposes).—Marsden's (Wholesale), Ltd., 47, Church Street, Preston.

Vortexion. No. 560,932. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Kirby (Wimbledon), Ltd., 72, Merton Road, S.W.19.

Primafa (lettering and design). No. 461,463. Class 8. Electric accumulators, batteries and parts thereof.—Accumulatoren-Fabrik Gesellschaft, Berlin, S.W.11. (E. Evans & Co., 27, Chancery Lane, W.C.2.)

Silver Knight (lettering and design). No. 462,995. Class 8. Apparatus for use in radio-telegraphy and telephony.—R. H. Eliot, 100, Victoria Street, S.W.1.

Superdyne. No. 462,682. All goods in Class 8.—C. G. Williams, trading as the British Radio Manufacturing Co., 9, South Castle Street, Liverpool.

Em-Pe-A-Adyne. No. 463,343. Class 8. Instruments and apparatus and parts thereof for use in radio-telegraphy and telephony.—The M.P.A., Ltd., 62, Conduit Street, W.1.

Omarvella. No. 463,527. Class 8. Radio-telephonic apparatus and parts, &c.—G. G. Stevens, 6, Storey Road, Walthamstow, E.17.

Xcel, All British (lettering and design). No. 459,114. Class 13. Electric kettles, cooking utensils, domestic irons, electric heating and soldering irons, and electrical fittings for use in connection therewith.—Automatic Telephone Manufacturing Co., Ltd.

Decko. No. 462,420. Class 13. Electric switches, fusible cut-outs, sparking plugs, and similar electrical fittings, but not including electric lamps and torches.—A. F. Bulgin, trading as A. F. Bulgin & Co., 9-11, Cursitor Street, Chancery Lane, W.C.2.

New Swedish-Danish Power Cable.—The Nordsjaellands Elektricitets og Sporvejsselskab (North Sealand Electricity and Tramway Co.) has, since 1914, received its electric current from the waterfalls at Lagen, near Halland, Sweden, by means of a 25,000-V line laid under the Sound. This company has recently, in co-operation with the Swedish Sydsvenska Kraftaktiebolag, of Malmo, the Frederiksberg Commune, and the Copenhagen Commune, laid a 50,000-V cable from Sweden to Denmark at a cost of approximately 2,000,000 crowns. This cable, which is said to operate at the highest pressure of any submarine cable in the world, has three conductors each of 95 sq. mm. cross section. The weight of the cable is 38 kg. per metre.—*Commerce Reports.*

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

London's Electricity Supply.

IN this issue we conclude a review of the London County Council's Return relating to electricity supply in the London and Home Counties Electricity District, for the year 1923-24, which comes opportunely when the Joint Electricity Authority has been constituted and the question of settling the standard prices to be charged by the London companies will shortly be taken in hand. Moreover, the current Return not only gives the data as usual for companies up to the end of 1923 and for local authorities up to March 31st, 1924, but for the first time includes the latest figures available for the companies—that is, up to the end of 1924. This is a convenience on which the compilers are to be commended. It is to be regretted, however, that the map showing the areas of authorised distributors in the Electricity District has not also been brought up to date; large spaces are shown uncoloured, although they have been allotted to various undertakers, and we believe it is correct to say that the whole of the District is now covered by statutory powers to supply electricity.

Undoubtedly the most interesting section of the Return at this juncture is that which deals with the methods of charging adopted and the prices charged by the various supply undertakings in the Electricity District. There are 89 authorised distributors in the District—44 local authorities and 45 companies—and they employ over 20 methods of charging; fortunately four methods predominate, namely: flat rate, sliding scale, maximum demand, and two-part tariffs. Amongst so many variables, it is not easy to institute a valid comparison, but taking the flat-rate charges only, the average decrease as compared with the previous year was in the case of lighting 3 per cent., power 18 per cent., and heating and cooking 9 per cent.

Of the metropolitan borough councils Poplar shows the lowest net revenue available for capital charges per kWh sold (0.61d.), closely followed by Stepney with 0.62d. Ten of the 16 councils received less than the average, which was 1.00d. Only one (Woolwich) drew upon the rates, to the amount of £2,844, and the net contribution in aid of the rates was £140,396.

Taking private lighting, power, and heating, with street lighting, the lowest revenue per kWh sold was at Woolwich (1.61d.), Poplar coming next with 1.65d., and Battersea and Stepney following with 1.81d. All the rest received more than 2d. The average for all was 2.26d.

Turning to the London companies, and excluding those giving only bulk supply, in 1924 the lowest net

revenue available for capital charges, 0.68d. per kWh sold, is credited to the London Electric Supply Corporation, which supplies energy to the Southern Railway; next comes the City undertaking of the Charing Cross Company with 1.06d. The average (including bulk supply companies, which received 0.35d. and 0.48d. respectively) was 1.84d.

For private lighting, power, and heating, with street lighting, no figure is given for the London Electric Supply Corporation, the revenue being lumped with that from traction; of the remainder, the lowest price per kWh sold is that of the South Metropolitan Company, 2.42d., the next in order being Westminster, 2.94d. The average is 3.14d.

The figures that we have quoted show that, roughly speaking, the London companies charge their consumers 40 per cent. more than the metropolitan borough councils do.

The Turbine Failure at Vereeniging.

THE breakdown of a turbo-generator at the Vereeniging power station of the Victoria Falls & Transvaal Power Co. on Monday last week was happily unattended by loss of life; but otherwise it appears to have been exceptionally thorough, the generator having been burst into fragments. The other three machines in this 40,000-kW station were damaged, but two of them were soon on load again, and the third will shortly be ready for service. By Thursday last week 95 per cent. of the normal peak load on the Company's system was being handled, as might be expected, seeing that the rated capacity of the several stations belonging to the Company aggregates 216,000 kVA.

The Vereeniging plant was set in operation in 1912; it is the second largest on this huge power system, which is fully loaded and works at a load factor of 70-80 per cent. A new power station at Witbank is being built by the Company on behalf of the Electricity Commission of the Union of South Africa, but will not be ready for use for some months to come. Quite recently the engineers were congratulating themselves on the fact that the boilers, many of which had been in use, heavily loaded, for 17 years, were as good as new and more efficient than when installed, but they have not been so fortunate with the turbo-generators, several of which, of German construction, gave them a good deal of trouble before the war.

The question arises whether the breakdown was due to a defect in design or material, or to age. At present we can but speculate on the matter, having no definite information regarding the origin of the fracture. When it is considered that the bending stresses in the shaft of a turbine running at 1,000 r.p.m. under the conditions obtaining on the Rand undergo some 8,000,000,000 reversals in 13 years, it will be seen that even the comparatively light stress involved may ultimately produce cumulative molecular effects of considerable importance. Up to the present we know of no other instance in which a turbine has "exploded" after many years' running, and it may be found that fatigue was not the cause of the Vereeniging breakdown.

Progress in Illuminating Engineering.

THE opening meeting of the Illuminating Engineering Society on November 26th was, as usual, marked by a good display of novelties. New arc lamps, colour projectors, motor-car headlights, and lighting fittings were amongst the exhibits. But of even greater interest, possibly, is the glimpse given in Mr. L. Gaster's report of the work on illumination that is going on simultaneously in so many different quarters—all ingeniously inter-related. The Committee working under the Department of Scientific and Industrial Research is a creation peculiar to this country. Its authoritative and impartial character lends special importance to its conclusions on industrial lighting. Evidence from this quarter with regard to the benefits of good illumination would be extremely valuable to the lighting industry, and we hope that before long it will be possible to make public some of its conclusions. Very useful work is also being done by the various B.E.S.A. committees. An informative standard specification for illumination photometers has recently appeared, and the work already done with regard to lamp standardisation is distinctly valuable. The amount of conscientious honorary work done by the members of such committees deserves more gratitude and recognition than it receives.

The second point emphasised at the meeting is the rapid growth of interest in illuminating engineering abroad. In the United States the Illuminating Engineering Society and its associated bodies have been conducting propaganda on a remarkably wide scale. We note that there are now three distinct societies interested in illumination at work in Germany, and Czecho-Slovakia is apparently to be reckoned as one of the latest recruits. There is no doubt that illumination is now entering the international phase, and it is therefore most desirable not only that there should be in this country a strong and well-supported body capable of voicing the national interests, but that this country should take a proper share in the international conferences of the future.

Swiss Industry Feels the Effect of Competition.

THE Commercial and Industrial Association of Switzerland recently issued a review of trade and manufacture in 1924, based on official statistics of imports, exports, &c., and on the detailed statements furnished by the different trade and group associations throughout the country. There was a general improvement in the activity of the machinery industry, unemployment having to a large extent disappeared and production having assumed a more stable character. The number of workpeople in 1924 exceeded the pre-war level, whilst the total exports of machinery and vehicles amounted to 53,500 tons, or a net increase of about 3,200 tons. Whilst the total value of the exports rose from 157 million fr. to 172 million fr., the average value per kg. fell from 3.35 fr. in 1923 to 3.22 fr. in 1924.

The progressive electrification of the Federal Railways was of great benefit not only to the electrotechnical industry, but to other enterprises. On the other hand, the export departments view future prospects with some anxiety. Nationalistic and fiscal tendencies, particularly in the countries directly affected by the war, have taken the form of extremely high protection for their home industries by the establishment of almost insurmountable Customs barriers. Consequently it is becoming increasingly difficult to export to certain countries which were formerly very good markets for Swiss machinery. It is felt that the loss of these markets will ultimately lead to unemployment. It is pointed out that wages in Switzerland remain on a much higher level than those in competing countries. The competition encountered in international markets has obliged Swiss firms to book contracts at unremunerative rates in order to provide employment at their works and maintain connections with their old customers. This may explain why the financial results of last year's operations were poor.

The makers of dynamo-electric machinery again complain of having to work under very unfavourable conditions of production compared with those prevailing abroad, especially in Germany. In consequence, they were frequenty obliged to accept orders at very low prices. On the whole, they experienced little difficulty in obtaining supplies of raw material, but paid increased prices for copper, brass, rubber, and, in particular, porcelain. The local electrification schemes brought considerable activity to works supplying railway material, distribution apparatus, and telephonic material, but makers of insulating material express themselves as dissatisfied with the volume of Government orders. Certain electricity works in Switzerland, it is said, do not give sufficiently favourable consideration to the local product, with the result that makers have been obliged to reduce their prices to an unreasonable level under the threat that the order would otherwise be placed in Germany.

Great Britain's Foreign Electrical Trade.

VOLUMES II and III of the annual statement of trade of the United Kingdom have just been issued. They include details of the import and export trade of the country in electrical machinery and apparatus, distinguishing the principal countries of origin or destination and the various main groups of productions. Comparative figures are given as far back as 1920. In considering these, it must be borne in mind that since April 1st, 1923, the trade of Great Britain and Northern Ireland with the Irish Free State has been included, whilst the direct foreign trade of the Irish Free State has been excluded. The effect of this alteration may be gauged from the following figures showing the total value of electrical exports from this country to the Irish Free State: 1923 (nine months), £120,560; and 1924, £378,540. In comparing last year's returns with those of preceding years, the price factor must not be lost sight of. In the returns relating to machinery, weights as well as values are recorded, thus furnishing a better guide to the real trend of trade. At the same time some allowance must be made for the alteration since the war in the design of generators and motors, less metal now entering into the construction of a machine of equivalent capacity and value. From fig. 1, showing the total imports and exports of electrical machinery in 1913 and from 1919 to 1924, certain broad tendencies are discernible. Imports, in weight, are scarcely within measurable distance of returning to their pre-war level; in value, they are slightly more than in 1923 but less than in 1922. Exports are about fifty per cent. over their 1923 level in weight and thirty per cent. in value. Compared with 1913, they are 4,200 tons more in weight and £3,000,000 more in value, surpassing the previous peak in value which was attained in 1921.

It is noteworthy that since 1919 the weights and value of imports have been strictly proportional.

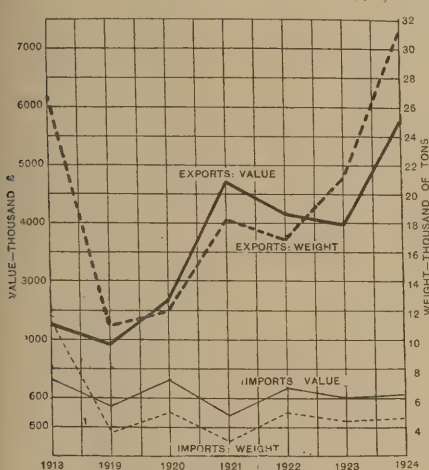

Fig. 1.—Imports and Exports of Electrical Machinery.

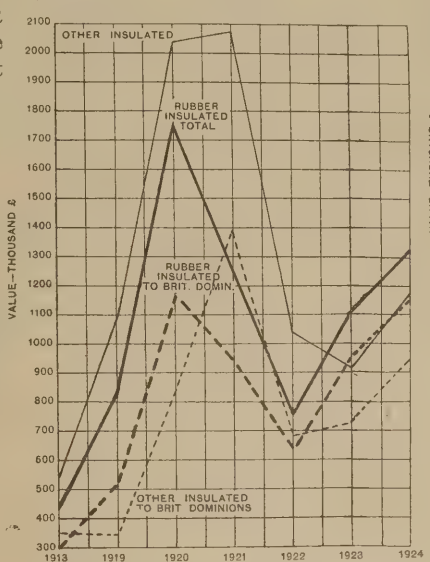

Fig. 2.—Exports of Cable (not Telegraph or Telephone).

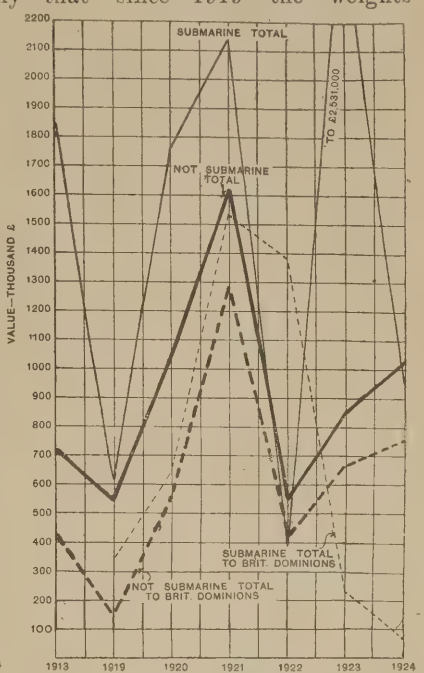

Fig. 3.—Exports of Telegraph and Telephone Cable.

Turning again to imports of electrical machinery, the largest item (as in 1923) is d.c. motors, although there has been a decline in this item. The totals last year and in 1923, with the chief supplying companies, are as follows:—

	1923. Tons.	£	1924. Tons.	£
Total ...	659	182,240	561	159,450
From Sweden ...	158	21,260	45	5,330
,, Germany...	81	12,520	184	21,090
,, Switzerland	46	10,975	21	6,260
,, U.S.A. ..	288	121,300	246	107,650

Imports of a.c. motors also are less than in 1923, *viz.*, 568 tons, value £74,400, against 681 tons, value £90,000. Of the 1924 total, £29,000 is credited to Sweden, £17,800 to the United States, and £9,800 to Germany, the share of the last-named in 1923 having been rather less. The value of the imports of "electrical machinery not elsewhere specified" is given as £611,000. This seems a large proportion of unclassified plant out of a total of nearly £1,100,000.

The steady upward course of our export trade in railway and tramway motors is strikingly shown in fig. 4. As in 1923, it accounted for about nine per cent. of the

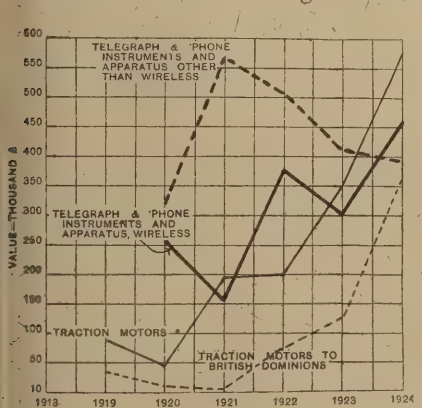

Fig. 4.—Exports of Radio, Telephone, etc., Apparatus and Traction Motors.

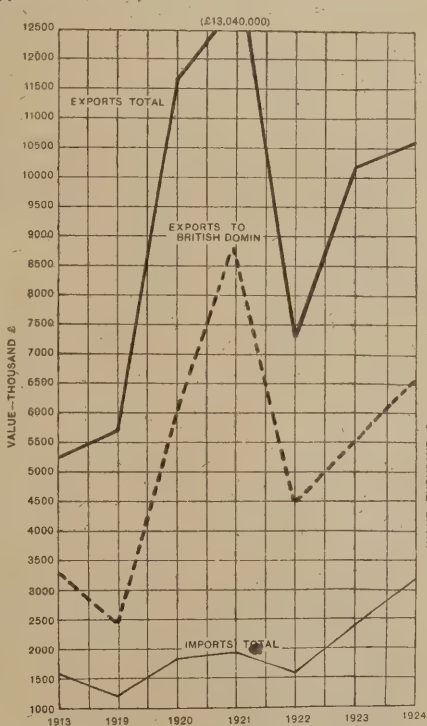

Fig. 5.—Imports and Exports of Electrical Goods and Apparatus.

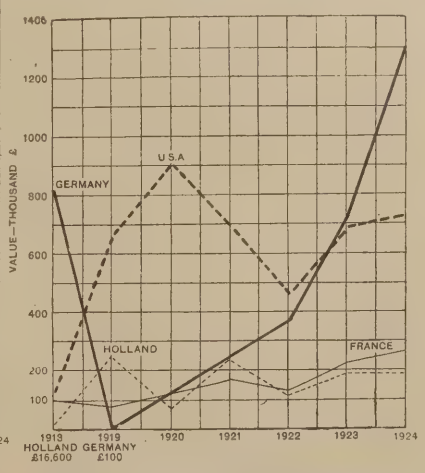

Fig. 6.—Origin of Imported Electrical Goods and Apparatus.

total value of our electrical machinery exports, whereas in 1919 the proportion was less than 5 per cent. The important place taken by Empire markets in this trade is also shown in fig. 4. It will be noted that the value of exports to those markets last year was five times that in 1922. To the Union of South Africa, shipments of railway and tramway motors rose in value from £6,500 in 1922 to £11,700 in 1923 and £208,300 in 1924.

The Empire is also our best customer for other motors, having last year taken a.c. types to the value of £446,400 out of a total of £568,900, and d.c. types to the value of £392,900 out of a total of £499,800. Of the former, exports as a whole are rather better than in 1923, but below the 1921 and 1922 levels, whilst shipments of d.c. motors are seen to be slightly higher in value but lower in weight than in 1923. India is not such a good customer as in past years, but Australia is a better one. The total exports of motors (other than railway and tramway) are shown below:—

	1921.	1922.	1923.	1924.
Motors, a.c., tons	3,928	3,185	3,293	3,640
Motors, a.c. ...	£1,051,300	755,930	555,500	568,900
Motors, d.c. ...	£668,700	404,040	493,250	499,800
Motors, d.c., tons	2,521	1,768	2,907	2,845

It is interesting to note also who are our principal customers for generating plant:—

British Exports.

	A.c. Generators.			
	1923. Tons.	1924. Tons.	1923. £	1924. £
Total	2,452	4,671	494,000	707,800
To India	340	521	60,780	79,160
,, Australia	547	804	135,900	125,390
,, New Zealand ...	161	354	23,080	52,316
,, S. Africa	143	409	37,240	75,630
,, Spain	375	18	86,990	1,266
	D.c. Generators.			
Total	1,854	3,283	380,500	544,600
To India	429	624	80,110	115,890
,, Australia	402	493	99,455	104,380
,, New Zealand ...	132	42	24,670	6,130
,, S. Africa	85	1,078	16,020	131,100

Exports of Electrical Goods and Apparatus.

Besides giving details of the trade in some of the chief classes of electrical machinery, the annual statement also divides the trade in electrical goods and apparatus into its principal groups, *e.g.*, telegraph and telephone material, cables, batteries and accumulators, and lighting accessories. An analysis of these statistics reveals the importance of our export trade in cables, the progress of which in the more important classes is shown graphically in figs. 2 and 3. The total of the submarine group calls for special comment. It shows up unfavourably in contrast with 1923, because in that year there was an exceptionally large export to the United States (value £2,131,000). America appears again as a good customer in 1924, and it will be noticed that the grand total is considerably more than in 1922, although less than in the "boom" years of 1920 and 1921. In the other groups, trade is fairly good, and to a very large extent with the Empire, as will be seen from the charts mentioned.

The general trend of the export trade in telegraph and telephone instruments is shown in fig. 4, distinguishing wireless from other types. The telegraph and telephone branch is a healthily growing trade, foreign as well as Empire sales being much larger in 1924 than in 1923.

For radio instruments and valves, our principal customers are as follows:—

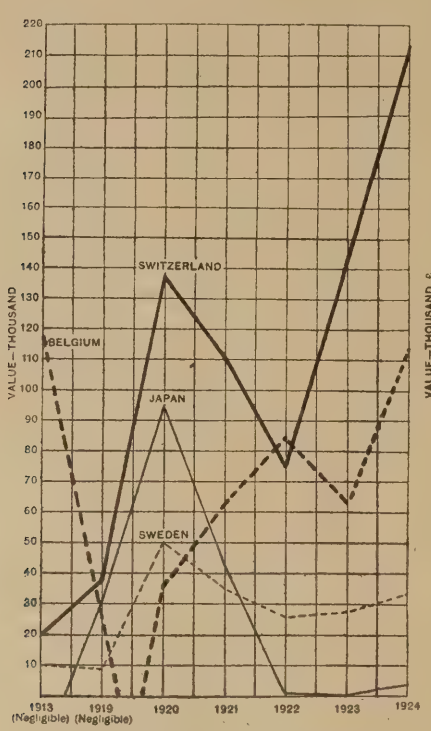

Fig. 7.—Origin of Imported Electrical Goods and Apparatus.

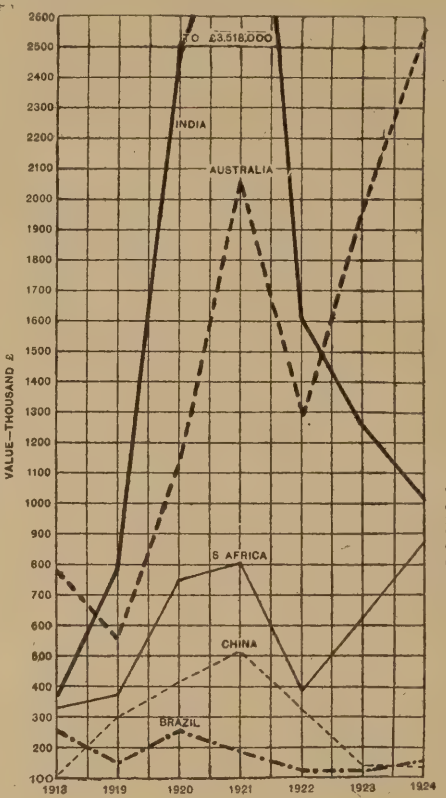

Fig. 8.—Destinations of Exported Electrical Goods and Apparatus.

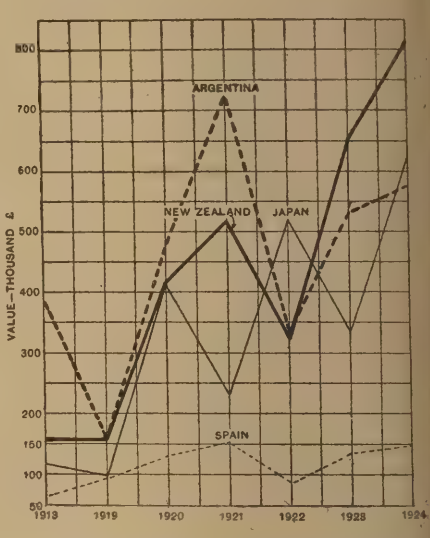

Fig. 9.—Destinations of Exported Electrical Goods and Apparatus.

	1922. £	1923. £	1924. £
Radio instruments.			
Total	377,000	309,000	465,000
To Spain	10,730	9,720	19,120
,, Greece	200	16,700	10,900
,, Japan	173,600	98,640	164,600
,, India	54,450	18,940	14,000
,, Australia	2,320	22,700	74,400
Radio valves, vacuum tubes, and X-ray tubes.			
Total	39,500	84,600	176,000
To Japan	6,000	21,000	37,600
,, India	1,200	7,000	10,360
,, Australia	2,400	12,400	30,680
,, S. Africa	3,100	2,700	24,600

Lamp exports show a slight advance and imports a slight decline, thus bringing the balance yet a little further in our favour. The supplying countries in 1924 are seen to be about the same as in the preceding year: Holland, £96,000; Austria, £51,000; and Germany, £37,000. Our best customer for lamps is Australia, which figures with gasfilled lamps to the value of £34,600, and other glow lamps to the value of £83,000 out of a total of all kinds of £341,000.

Fig. 5 shows the relative position of the total import and export trade in 1913 and since the war (omitting 1914-1918 as being abnormal years) in electrical goods and apparatus, together with the proportion of exports that have gone to the British Dominions.

This introduces the question of the countries now supplying our imports of electrical goods and apparatus and how their respective shares have varied in recent years.

Figs. 6 and 7 show the values of the imports (retained for consumption) of this group, in recent years and in 1913, from the principal countries of origin. It will be noticed that the value of Germany's imports is now above pre-war level. The increase in the grand total

from all countries is spread over nearly all the principal groups. For example, imports of wireless goods are nearly double in value compared with 1923, whilst those of other telegraph and telephone apparatus show an increase of nearly 60 per cent. The battery and accumulator group show advances in value of about 150 per cent., and the imports of lighting accessories and fittings an increase of nearly 50 per cent. In every case Germany has considerably advanced her position. There is an increase in the value of imports of rubber-insulated wires and cables (not telegraph or telephone), in which Germany, Belgium and Switzerland all share. Amongst minor importers Austria, Hungary and Denmark are becoming more noticeable.

Finally, Figures 8 and 9 show graphically the progress of our trade in electrical goods and apparatus with the principal consuming markets. Promising South American outlets other than those shown in the charts are as follows:—

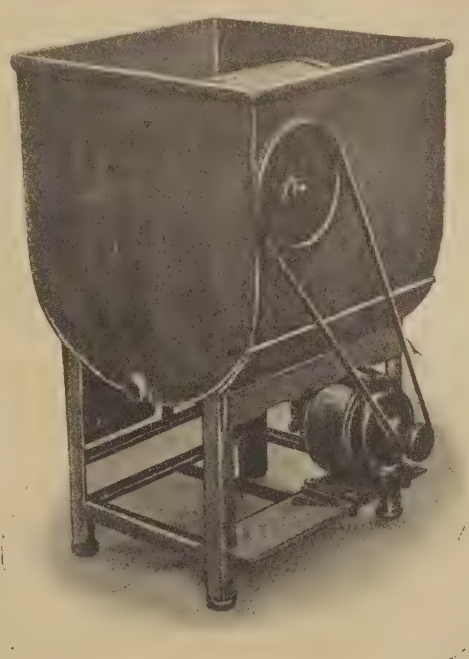
Exports to:	Peru. £	Chile. £	Uruguay. £
1913	10,500	77,600	15,900
1919	108,700	57,400	8,500
1920	341,500	87,800	28,800
1921	16,700	266,000	17,600
1922	4,450	288,000	7,800
1923	64,700	101,000	50,000
1924	34,700	116,000	18,000

Choosing and Using an Electric Washing Machine.

Introducing the "Gaslectric" Washer.

By N. L. W. E.

"WASHING machines in the United States.—The American Washing Machine Manufacturers' Association reports that during the first quarter of the current year its members sold 197,764 washing machines, of which 160,353 were electrically operated. In the equivalent quarter of 1924 the total number of machines sold was 179,461, and of these 148,847 were electrical."—ELECTRICAL REVIEW, June 19th, 1925.



I was greatly impressed by "Wren's" article, and your editorial, on "Choosing a Washing Machine" in the ELECTRICAL REVIEW of September 4th and 11th. Like him, I was required to foot the weekly wash bill, and also the incidental losses due to damage and replacements. Realising the advantages and, incidentally, the load-building potentialities of the electric washer, I also made inquiries with a view to purchase, but was deterred by the high price—£45 to £60. Not to be denied, I constructed a machine at less than one-third the cost of the cheapest machine then on the market, to which I geared a ¼-h.p., a.c., squirrel-cage motor.

From this beginning, and after more than three years' concentration on the subject, there has been evolved an electric washer which embodies not only the desirable features enumerated by "Wren," but also several more important points which, so far, he has not mentioned. These, with the Editors' permission, I will now endeavour to amplify and explain.

Apart from their high price, many of the machines at present offered are too large, not only in size, but in washing capacity, for the average-size family and for the floor space available. Existing machines are often constructed largely of wood, which not only tends to absorb the washing liquor and to become insanitary, but, when not in use, is liable to shrink and leak. With few exceptions, existing machines have to be supplied with hot water, which, during the washing operation, gradually cools. Any steam-laundry operative knows that in order satisfactorily to wash cotton and linen articles, the initial temperature should be but moderate to prevent the fixation of stains, &c., and gradually increased until, finally, a bleaching and sterilising temperature is attained. This consideration is fundamental if the purity and "colour" of linen articles are to be maintained, and involves the provision of a heating element, which most existing machines do not possess, if the necessity for a separate boiling "copper" is to be avoided.

Moreover, existing machines with automatic reversing gears and geared wringers necessitate frequent attention if failure due to insufficient lubrication is to be avoided.

As "Wren" points out, there are many different types of washing machines of American and European manufacture, but those which are driven by electricity have, so far, failed to attract the British public. One cause of failure has undoubtedly been the unnecessarily high cost of production, and the consequent high price of the machines so far designed and offered. There are possibly other contributory causes of failure, but it is mainly the high price which has limited the market to the relatively wealthy classes, who, however, can easily afford to patronise the steam laundries, and are

The "Gaslectric" Washing Machine.

not interested in saving money or labour by having washing done at home. Moreover, the electric washers offered to the public are, in fact, combined washing and wringing machines. The wringer attachment contributes very largely to the cost of the machine, as will readily be understood, and apart from introducing a somewhat dangerous piece of power apparatus (several serious accidents have occurred), the wringer does not completely take the place of the combined wringing and mangling hand-operated machine, which, in Great Britain, is regarded as an indispensable requirement of every modern household; that is to say, such large articles as bed-sheets, table-cloths, bed-spreads, and

blankets, which do not require ironing, must be finished, if washed at home, by means of the family mangle. As the mangle invariably serves also as a wringer, the difficulty of selling an additional wringer, attached to a washing machine, at a relatively high price, will readily be perceived.

It may be assumed that in the average British home mechanical skill is practically non-existent, and complicated instructions as to oiling and adjusting and operating emergency release mechanism in case of accident tend only to frighten prospective users. It is claimed by the makers of the "Gaslectric" washer that they have constructed a machine which not only eliminates these disadvantages, but also possesses advantages from both the utility and selling points of view which have not hitherto been offered or provided, the net result being a machine of sound engineering design and construction, of proved utility, at a cost which enables the price to the public to be kept within the reach of practically every one who occupies a house supplied with electric current. This has been accomplished—

(1) By eliminating the geared wringer, but the machine is built strong enough to have a hand wringer (cost 25s.) attached if desired.

(2) By running the main machine-cut speed-reducing gear immersed in the soapy washing liquor, no other oil lubrication being required. The belt (sewing machine type) drive to the motor provides the necessary safety device to protect the motor. The gear consists of a polished shaft of stainless steel, running in ball bearings, and a cut gunmetal worm wheel mounted directly on the rotary drum.

(3) By providing gas-heating apparatus to maintain the liquor at the correct temperatures for washing woollen articles, cottons, and linens, and also for boiling and sterilising. Being a gas-using appliance, it is an attractive proposition to gas-supply as well as electricity-supply authorities—an important consideration from the sales point of view, especially where both gas and electricity are supplied by one authority.

(4) The machine is constructed mainly of galvanised steel, a material which for generations has proved its utility for this purpose in this country. The machine is therefore perfectly sanitary, non-rusting, and non-shrinking when not in use.

(5) The machine occupies the minimum of floor space (17 in. by 21 in.), and is provided with a strong flat-topped metal cover, which serves also as a useful side table when placed in a scullery or kitchen, as it would almost invariably be in this country.

(6) The machine is practically silent in operation, and functions on the well-known rotary-drum principle, the effectiveness of which cannot be gainsaid; but unlike all other rotary machines, it is so designed that the need for automatic reversal of rotation has also been eliminated. The result of these features, which form the principal claims in the British patent, is a rotary washing machine of the cheapest possible construction consistent with sound engineering design. The effectiveness and general utility of the machine have been proved by regular use for more than three years, during the past year of which neither the machine nor the motor has been oiled or attended to by any skilled person. Apart from a heavily-insulated press-button switch (Home Office pattern), the machine has no mechanical controls. Smooth-running, rustless "domes of silence" are fitted instead of iron castors, which stain the floor with iron-mould, and are very liable to cause trouble.

The Theory of Mechanical Washing.

The accepted story of the cleansing process is, in the rotary machine, repeated immersion of the articles in *hot* soapy liquid, partial draining of the articles by lifting and slight pressure, and re-immersion, in order to cause free and continuous circulation of the liquid through the fabric. In the "Gaslectric" washer the special formation of the rotating drum—which is unique in power-driven washing machines, and, therefore, unfamiliar to experts in laundry operations—enables the washing process to be completed satisfactorily by rotation in one direction only. The time required, other conditions being equal, is not materially different from that of the two-way machine, as anything in excess of the recognised maximum effective speed (16 r.p.m.) tends, by centrifugal action, to retard complete washing, whatever the type of machine.

That the "Gaslectric" washer is satisfactory and effective, in completing the washing process, is proved satisfactorily by long experience, and also by independent and hypercritical inspection of the articles washed. Further proof is the entire lack of evidence of undue wear, although many articles have been washed by the machine every week for two or three years.

The Potentialities of the Electric Washer.

Referring now to the opening paragraph of this article, indicating the enormous business done in electric washers in the United States, it should be unnecessary to point out that the domestic consumer offers at the present time the greatest possibilities for economical electrical development. This field is in this country practically untouched, so far as electric washers are concerned, and energetic development should yield a splendid return to all concerned. Casual observation during the early part of the week will show the immense extent to which the washing and drying of clothes is carried on in residential districts of all classes.

It has been stated on the highest authority that 90 per cent. of the country's weekly wash is still done, more or less laboriously, at home by hand. The true significance of these facts, from the sales development point of view, does not appear to have been fully appreciated by British manufacturers and electricity supply authorities, if one may judge by the limited number of excellently-appointed, but relatively high-priced, electric washers hitherto available.

To these and all others interested in mitigating household drudgery by promoting the use of domestic labour-saving devices, the main feature of the "Gaslectric" washer is its relatively low price, which is about half that of the next lowest-priced washer of its class now on the market.

The capacity of the No. 1 or smallest "Gaslectric" washer is one full-sized blanket, or four full-sized sheets, or the equivalent in other articles. The motor is also of British manufacture, self-oiling (ball bearings), insulated, suitably protected, and of $\frac{1}{6}$-h.p. capacity.

I can endorse all that "Wren" has said of the electric washer as a money, time, and labour saver. Bed-linen, for instance, can be, and, in my own experience, frequently is, washed, dried, finished, aired, and replaced in use during the same day.

The "Gaslectric" washer is fully protected by British patent, and the makers (Messrs. T. Balmforth and Co., Ltd., Luton) state that they are in a position to give early delivery.

Royal Institution.—The lecture arrangements at the Royal Institution before Easter next year were announced at the general meeting of the members on December 7th. The Juvenile Lectures, the 100th Course, will be delivered by Sir William Bragg on "Old Trades and New Knowledge," commencing on December 29th, at 3 o'clock. On Tuesdays, at 5.15, beginning on January 19th, there will be two lectures by Dr. J. A. Crowther on "X-rays and Living Matter," two by Dr. E. K. Rideal on "Surface Action," four by Professor Barcroft on "The Egg," and two by Dr. C. H. Desch, on the "Growth of Crystals." On Thursdays, *inter alia*, there will be three lectures by Dr. C. D. Ellis on the "Atom of Light and the Atom of Electricity." On succeeding Saturday afternoons there will be four lectures by Sir Ernest Rutherford on the "Rare Gases of the Atmosphere and their importance in Atomic Theory." The Friday evening meetings will begin on January 22nd, when Sir William Bragg will deliver a discourse on the work of the Davy Faraday Research Laboratory. Succeeding discourses will probably be given by Sir J. J. Thomson, Sir Ernest Rutherford, and other gentlemen.

Electric Washing Machines.—I.

THE electric washing machine has not made much headway in this country if judged by the United States standard, but there is little doubt that a market exists if efforts are made to meet the requirements—both constructional and financial. The first cost of a washing machine is undoubtedly heavy; this is a serious handicap which has a greater effect in this country than in the United States. Even in the latter country, however, arrangements are made to spread the cost over a year or two, and this has much to recommend it. On this basis it is much easier to compare the cost of electrical washing with older methods. Account is taken of weekly laundry charges or the cost of assistance in the home, &c., and the amount is placed side by side with the periodical payments made for the machine, when it is seen that if there is a difference in favour of the older methods, it is more than outweighed by non-pecuniary advantages.

By intensive advertising and the adoption of the instalment system of payment, a huge business has been built up in the United States. According to a recent statement which appeared in the *Electrical World*, there were 50,000 electric washing machines in use in the United States in 1914. Ten years later; in 1924, the number had grown to over 4,000,000, the value of the machines being put at $600,000,000. At the present rate of growth, it is estimated that in 1929 there will be over 7,600,000 electric washing machines, or, allowing an increase in the rate, 9,000,000. It is estimated that in 1929 the replacement rate alone will be 700,000.

So far as can be ascertained, sales of electric washing machines in Great Britain represent only an infinitesimal fraction of the American figure, Domestic drudgery is hard to eradicate in this country, but there must surely be a bigger market for these machines than the sales would indicate.

In an endeavour to stimulate interest in the subject, we illustrate below several examples of British washing machines. The term "British" has had to be extended to include machines from the other side of the Atlantic which are supplied by British firms.

Two kinds of washing machine are marketed by the General Electric Co., Ltd. The first (fig. 1) is not strictly a "machine," for there are no moving parts, the work being done by the circulation and percolation of hot water. It consists of a galvanised iron tank, with heating elements fitted in the base, and a vertical tube passing upwards through the centre of the tank. It is made in 10-gal. and 14-gal. sizes and provision is made for the fixing of a wringer. The other "Magnet" washer is illustrated in fig. 2. This is a compact machine designed on rational lines employing the reciprocating perforated cylinder operating in the tank which forms the body of the appliance. Simple controls are provided and the motor is of the enclosed pattern placed well out of the way. A swinging wringer is fitted in a convenient position.

Messrs. Whittaker Bros. (Accrington), Ltd., produce the "Electric Pioneer" washing machine illustrated in fig. 3. Wood is largely employed in the construction of this machine, the water box well being made of Louisiana cypress and the revolving drum of hardwood and tinned woven copper wire. The driving gear is placed on either side to suit the buyer's convenience and is covered in by a wire guard. The size of the wringer (24 in. by 6 in. brass-capped rollers) is somewhat uncommon, most electric washers being equipped with much smaller wringers. The machine is mounted on castor wheels to facilitate movement. A .5-h.p. motor provides the drive.

The "Laundry Queen" washing machine, shown in fig. 5, is sold by the Northern Steel & Hardware Co., Ltd. This is of very simple construction, consisting of a wooden tub mounted on a square frame fitted with castors. Through the lid of the tub passes the shaft of a rotating dolly or "Turbo-Vac." This dolly has four arms, each of which consists of two cupped wings which set up a suction as they rotate and draw the dirt from the clothes in the tub. The wringer can be easily swung and locked into any position and the drive of the rollers allows both forward and reverse motion.

Fig. 4 illustrates the "Western Electric" washing machine supplied by Standard Telephones & Cables, Ltd. This appliance is of handsome appearance, having a grey enamel body, top and cover of polished aluminium, and nickel-plated control handles. The clothes are placed in a perforated cylinder which is arranged to make six revolutions in each direction alternately. The wringer, fitted with an all-metal drain board of generous proportions, is supported at one end by means of a vertical arm above the washer. Overloading is prevented by safety friction clutches on the washer and wringer drives. All the mechanism is totally enclosed but easily accessible for cleaning.

Fig. 1.—A G.E.C. Washer.

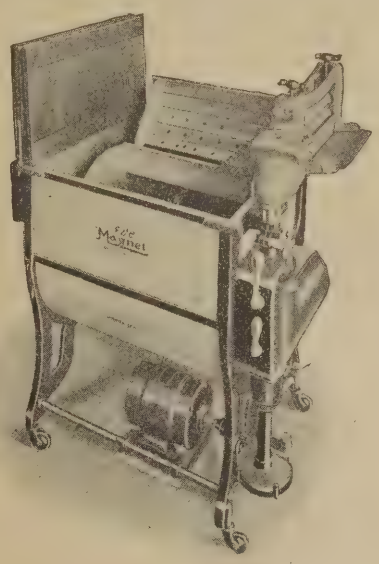


Fig. 2.—The "Magnet" Washer.

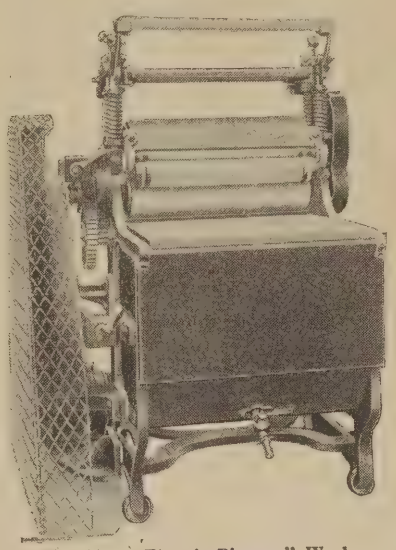

Fig. 3.—The "Electric Pioneer" Washer.

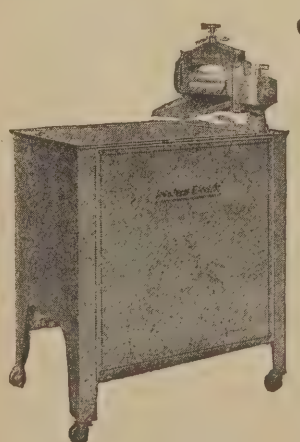

Fig. 4.—The "Western Electric" Washer.

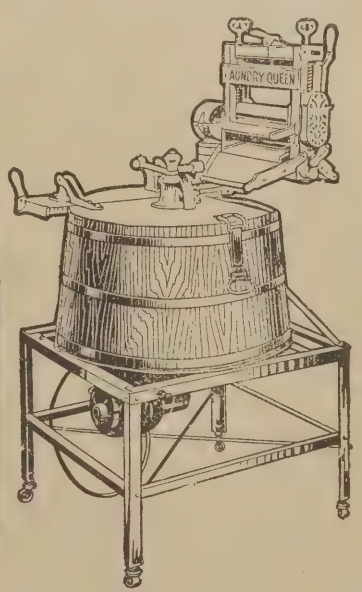

Fig. 5.—The "Laundry Queen" Washer.

Messrs. L. G. Hawkins & Co., Ltd., supply the "Universal" washer depicted in fig. 6. From the illustration the construction and operation of the machine can be clearly seen. It has a sheet steel body beautifully finished in blue enamel and the clothes are put into a reversing perforated cylinder of non-rustable metal. The drive is wholly by gears which run in an oil bath and are noiseless, the motor having a rating of 0.25 h.p. It is claimed that six full-sized sheets can be washed in this machine in 15 minutes. The wringer is fitted with a safety release device and an overload release is also provided.

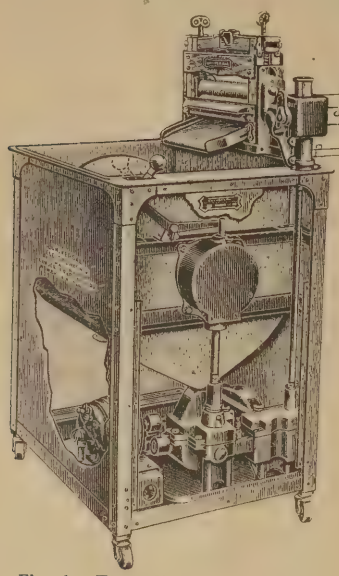

Fig. 6.—The "Universal" Washer.

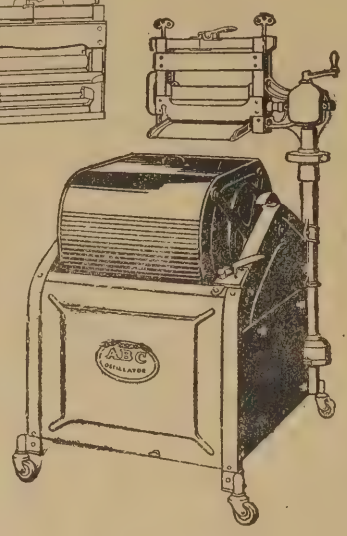

Fig. 7.—The "A.B.C." Washer.

One pattern of the "A.B.C." washer sold by the Sun Electrical Co., Ltd., is shown in fig. 7. This is a semi-enclosed machine with a rocking tub. The agitation of this tub forces the hot water through the clothes at each movement. The tub is of copper and is tinned on the inside. When not in use the tub is locked into a vertical position. A swinging wringer, with a reversing lever, is fitted, and this, as usual, is equipped with a quick-acting safety release. The body is finished in grey enamel.

Messrs. Duncan Watson & Co. are the agents in this country for the "Rotarex" machine illustrated in fig. 8. This is also of the reversing-cylinder type fitted with a wringer. The body is constructed on plain lines and is mounted on four legs fitted with castors. The driving gear is well enclosed and the motor is mounted underneath the tank.

The last example (fig. 9) is the "White Cap" washer which

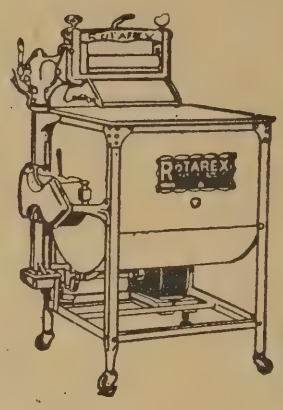

Fig. 8.—The "Rotarex" Washer.

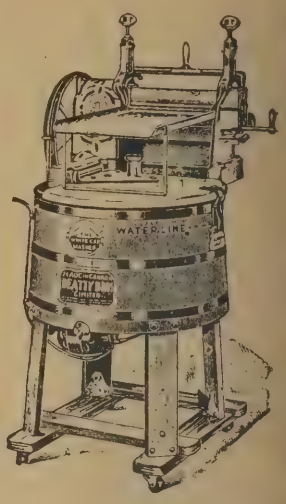

Fig. 9.—The "White Cap" Washer.

is made in Canada by Messrs. Beatty Bros., Ltd., who also market the machine in this country. The body of this consists of a wooden tub mounted on a framework of the same material. The machine operates on the dolly principle, this member being fitted in the lid of the tub. The wringer is driven by a belt which operates a rather large wheel.

Super-Station Switchgear.

The Trend of Modern Practice.

By A. MENTOR.

THE supply of switchgear to meet adequately the demands of modern large super-power stations is a subject of first-grade importance to the electrical industry in this country owing to the very large extensions and interlinkages which are now under construction or being actively contemplated.

The supreme importance of maintaining supply is fully recognised in all quarters, and there can be no question that the aggregation of large power units, bigger power stations, and the interlinking of these stations, together present to the designers and manufacturers of switchgear a number of problems of grave difficulty; upon the correct solution of these difficulties very heavy issues are at stake.

A cursory examination of switchgear equipments as installed in the most recently designed stations will at once reveal that there is no unanimity of opinion as to the design of oil circuit breakers or the physical design and lay-out of the switchgear best suited for the duty, and the standardisation of practice in even the moderate-sized station is apparently a long way from being an accomplished fact. Whilst there are undoubtedly the elements of progress inherent in the trial of various expedients to accomplish a given end, the position is only satisfactory in so far as such expedients have for their basis a proved ability to accomplish that end; and in this respect the position is unfortunately not as strong as could be desired when considering very large stations.

The actual rupturing ability of oil circuit breakers in major stations should be beyond question, and extrapolation from small designs is hazardous when tests to confirm new and larger designs cannot be made; furthermore, experience from casual happenings in operation cannot be relied upon to make good any deficiency, owing to the impossibility of securing adequate observation of the various phenomena which occur, and to the known inconsistency of performance even under tests which are controlled to the maximum degree possible.

That there is not available testing plant capable of stressing to their limit designs which are now in common use in this country, is a matter for great regret; and the degree of benefit to be derived from the experience of foreign designers who have proper test facilities at their disposal is necessarily restricted to one or two firms having access to the researches of big manufacturing companies abroad. The inability to make tests which will define the limit of safe operation will naturally reflect on the breaking ratings ascribed to oil circuit breakers, and much divergence of opinion is noticeable when breakers having the same nominal rupturing capacity are compared with each other—showing that, at best, only empirical design data, little better than guesswork, have been available.

Similarly, the arrangement of switchgear in general, and its physical design, display variations which can hardly be reconciled with an accepted and uniform degree of safety in operation. This broader aspect of switchgear safety is, of course, beyond the region of experimental test and proof and the adequacy of designed layouts to fulfill their function can only be established by satisfactory experience in service.

Fault conditions which would be capable of putting to the proof our super station switchgear have happily been of rare occurrence, and this in itself constitutes a high tribute to the care and thought which our switchgear engineers have displayed, but it should not be accepted

as a natural consequence that such a degree of immunity from trouble as has favoured us in the past will necessarily continue under the changed conditions which are impending, and furthermore, it must be remembered that the knowledge which such failures would have afforded has not been rendered available to guide practice in catering for our future requirements. It is necessary, therefore, to look very carefully into all the facts available, and to examine, particularly, such experience as has followed developments the most nearly approximating to those which we contemplate, in order to determine what our own future policy should be.

It is, of course, known that in the United States power stations of very large size, corresponding with some of those now contemplated in this country, are in active operation, and those who have watched the progress of events will be aware that during a period of a few years wherein such stations were being brought into commission, there was a considerable number of switchboard failures of a very disturbing magnitude, causing much dislocation of service and corresponding loss. As a result of knowledge brought to light by these failures, it is not too much to say that American practice on large switchboard installations underwent a complete change. This change has been exemplified in probably about twenty different stations constituting all the large installations which have been placed in commission since its inception.

The effect of a short circuit in, or close to, a power station having a quarter of a million kVA of generating plant is best left to the imagination, and whilst no effort should be spared in attempting to produce circuit breakers which can interrupt the maximum flow of energy which may be involved, the issues at stake are too vital to justify reliance on the circuit breaker alone as the only means of avoiding disaster.

It is possible, by the insertion of earthing resistances, to limit the flow of earth fault current to a value which can be interrupted readily and without disturbance to the system. Further, the application of current-limiting reactors can, in ways now well known, be made to provide some measure of limitation to the fault current which may flow between phases, and sectionalisation of bus-bars also will contribute to that end. Nevertheless, these provisions alone, because of their limitations as to application and operation, do not provide a sufficient safeguard for apparatus forming the very nerve centre of a large electrical power system, and search must be made for means of definitely preventing the occurrence of phase faults on main switchgear.

These are the considerations which led to the development in the United States of what is now known as isolated phase switchgear, the name of which serves to indicate that each phase is separated bodily from the others, as completely as can be accomplished. This is done either by vertical walls, as in the earlier installations, wherein the gear was installed in what were virtually three separate single-phase switch houses, or, as in the arrangement which has come to be regarded as standard practice, on three separate floors of one building. The latter arrangement allows that a longitudinally placed vertical dividing wall can produce six separate compartments, three for the main bus-bars and three for auxiliary bus-bars, and transverse walls can provide sectionalising barriers between various portions of each bus-bar.

Even with these precautions, trouble was not eliminated entirely until experience had demonstrated the steps which were necessary to ensure that the provisions made for simultaneous operation of the three phases of oil breakers and isolators could not be also the channel whereby trouble could spread from one phase to another.

Descriptions of the various installations carried out have been published from time to time, and it is not the purpose of this article to repeat this matter in detail. There are, however, in connection with such schemes, a number of points which are not immediately obvious from either a bare definition or a detailed description, and some of the outstanding points can be conveniently reviewed.

The main object accomplished in such gear is to ensure that within the premises of a super-station switch house there will be no point at which the phases are brought close together. The outgoing feeders, &c., may be three- or single-phase cables, or overhead lines, but the principle of separation must be carried through until the conductors pass beyond the switch house. Safety may, in many cases, demand that series reactors be placed in the run of the conductor from the switchgear to the cable sealing ends, and, in this event, the reactors for the different phases are necessarily separated in the same way as the remainder of the gear.

When duplicate bus-bars are provided and isolated from each other there must eventually be a common point at which the duplicated switchgear conductors arrive at the single out-going conductor, and it is necessary, if the maximum safety possible is to be actually achieved, that the common point be on the side of the oil circuit breakers remote from either set of bus-bars. It will at once be seen that this calls for duplicate circuit breakers as well as duplicate bus-bars. Owing to financial considerations it has not been the practice, heretofore, as a rule to use duplicate circuit breakers in this country. In view of the major developments impending in the next few years, however, it is suggested that this feature requires reconsideration, as no expense is too great to ensure immunity from breakdown at such vital points.

The question of cost is obviously one of great importance, and the first impression in regard to isolated-phase arrangements is that they must necessarily be more costly than the arrangements heretofore common in this country. This is not necessarily the case, since there are advantages inherent in the scheme which enable considerable price-saving to be realised. The matter of the space occupied is tied up very closely with the question of cost, and very careful estimates have been made to arrive at comparisons between equivalent equipments laid out according to the isolated-phase scheme and schemes of older form. The results show, in general, that the cubic space occupied is practically identical, and it is possible, therefore, to make comparisons based on engineering and technical considerations without being hampered by any material handicap from the financial point of view on either the one scheme or the other.

In summarising the advantages of isolated-phase switchgear arrangements, it may be said that:—

1.—Phase-to-phase short circuits on switchgear are impossible. The trifurcating box of a three-core cable, if such be used, is the nearest point to the bus-bars at which such an occurrence can take place, and series current-limiting reactors can, in the extreme case, be used to limit the value of current in such a fault.

2.—The large spacing which naturally results from the isolated arrangement of phases reduces to a very marked degree the electromagnetic stresses which can result from a fault external to the station switch house.

3.—High-voltage connections are simplified by their single-phase arrangement as no phase crossings are required, and in general their length can be materially reduced. The introduction of reactors were required can be more readily and conveniently effected.

4.—Flexibility of operation under emergency conditions is greater than on other arrangements as, owing to the complete physical separation, any phase can be worked on with complete safety, and the cramping effect of adjacent phases is removed.

5.—The operating solenoids or other mechanisms of the circuit breakers are removed from proximity thereto, and inspection is the more readily and conveniently carried out. Isolator mechanisms too can be arranged alongside the appropriate breaker mechanisms, and mechanically interlocked therewith by robust and visible devices.

These advantages are fundamental in character, and are peculiar to the system of arrangement, and their value cannot be questioned. In these circumstances it follows that engineers entrusted with the preparation of plans for the super-power stations of the future in this country cannot afford to ignore a switchgear scheme which had its origin in troubles experienced in stations of similar magnitude elsewhere, and which has given good service in the large equipments to which it has been applied.

Legal.

British Thomson-Houston Litigation.

THE injunctions granted *ex parte* on December 4th by Mr. Justice Tomlin in the Chancery Division to the British Thomson-Houston Co., Ltd., restraining R. H. Wood, E. A. Siderman, and Walter Thomas Smith, Ltd., from infringing its electric lamp patents by selling imported lamps, were mentioned to his Lordship on December 8th.

Mr. TREVOR WATSON, for the plaintiffs, said that Mr. Wilfred Hunt, for W. T. Smith, Ltd., wanted time to consider the matter, and he therefore asked that the motion against the company should stand over for a week on an undertaking. With regard to Siderman he asked for an interim injunction until the trial.

Mr. SIDERMAN, who appeared in person, said he was willing to submit to a perpetual injunction.

His LORDSHIP said that could not be done except by consent.

Mr. WATSON said that the third defendant, R. H. Wood, was evading service.

His LORDSHIP suggested that the *ex parte* injunctions against all three defendants should be continued for a week and that in the meantime the plaintiffs should consider whether they could put an end to it as against Mr. Siderman, as they ought not to incur any undue costs.

Mr. Watson agreed, and this course was taken.

The *ex parte* injunction obtained on December 4th by the British Thomson-Houston Co., Ltd., restraining the London Electric Lamp Co., of Sandcroft Street, Kennington, S.E., from infringing its electric lamp patents, was mentioned to Mr. Justice Tomlin in the Chancery Division on December 8th by Mr. Trevor Watson, who said that plaintiffs had not been able to effect service on the company, and he asked that the motion should stand over for a week in order, if possible, to trace the man who had to be served.

His LORDSHIP acceded to the request.

IN the Chancery Division on December 11th, Mr. Justice Astbury had before him a motion on behalf of the British Thomson-Houston Co., Ltd., for an injunction to restrain the Electric Service Company from infringing letters patent which Counsel said had been upheld by the Courts. An interim injunction had been granted over that day, and Counsel asked that it should be continued until judgment in the action or further order.

The defendants were not represented and his Lordship made the order.

British Insulated & Helsby Cables, Ltd.'s Pension Fund.

THE decision of the House of Lords on the appeal of the British Insulated & Helsby Cables, Ltd., against a judgment of the Court of Appeal in its dispute with the revenue authorities on income tax assessment for the year ended April, 1918, was given on December 11th. The company claimed to be entitled to deduct a sum of £31,874 made to a pension fund for the benefit of its clerical and technical staff in computing the profits for the purpose of assessment to income tax for the year ended April 5th, 1918, and appealed to the Special Commissioners on the point, with the result that their appeal was allowed. Mr. Justice Rowlatt upheld this decision, but the Court of Appeal reversed it. The final appeal was heard and judgment reserved on October 26th. By a majority their Lordships dismissed the appeal, the Law Lords taking this view being the Lord Chancellor and Lords Atkinson and Buckmaster, and the dissenting members being Lords Carson and Blanesburgh. The Lord Chancellor said that the object and effect of the payment of this large sum was to enable the company to establish the pension fund and to offer to all its existing and future employés a sure provision for their old age, and so to obtain for the company the substantial and lasting advantage of being in a position throughout its business life to secure and retain the services of a contented and efficient staff. He was satisfied, on full consideration, that the payment was in the nature of capital expenditure, and accordingly that the deduction of the amount from profits, although not expressly prohibited by the Act, was rightly held by the Court of Appeal not to be admissible.

Metropolitan Water Board v. North Metropolitan E.P.S. Co., Ltd.

MR. JUSTICE ROMER, in the Chancery Division on December 10th, delivered judgment on a special case stated by the Metropolitan Water Board raising the question whether the King George reservoir at Chingford came within the words "other source" contained in Section 15 (1) of the Electricity Supply Act, 1919, which states:—"The Board of Trade, on the representation of the Electricity Commissioners, may authorise any joint electricity authority, or any authorised undertaker, to abstract water from any river, stream, canal, inland navigation, or other source, to enable the undertaking to utilise and return the water, subject to such conditions as may be specified in the order."

His LORDSHIP said there was also the further question whether it was within the power of the Minister of Transport to authorise the North Metropolitan Electric Power Supply Co., Ltd., to abstract water from the reservoir. But inasmuch as the company was an authorised undertaker within the meaning of the section there could be no doubt as to the power of the Minister to make such an order if the first question was answered in the affirmative, if he was satisfied as the result of an inquiry that it was proper to make an order. With regard to the first and principal question his LORDSHIP said the words "other source" in the sub-section were not used in the sense that they were used when speaking of the source of a river or stream. The word "source" must mean some body of water from which water was capable of being abstracted and to which it could be returned. If a reservoir was not included in the words of the sub-section then it must be because the expression "other source" included a certain species only of such bodies. A reservoir was different from a river or stream in that it was exclusively appropriated for a definite purpose. But so was the water in a dock or canal. The fact of appropriation was not therefore a sufficient reason for excluding a reservoir from the scope of the words "other source." The plaintiffs had contended that having regard to the provisions of the section as a whole and to the purpose that the Legislature must have had in view, a reservoir must be taken to be excluded from its operation. He could, however, find no justification whatever for this. The plaintiffs also submitted that the sub-section only related to such water as could be abstracted without trespassing on land belonging to others; that the Minister had no power to enable anybody to pass over the property of a third party to do this; and that it was inconceivable that the Legislature intended to confer upon him the power to authorise interference with the rights of property without compensation. Of course it was true that the electricity authority or undertaker, though not the owner of land adjoining the water, might by agreement obtain the right to lay its pipes over the land for the purpose of abstracting and returning the water. But there could be no object in obtaining such a right, and he did not know that the authority or undertaker would have any power to obtain such a right, unless and until the right of abstraction was clear. In the circumstances he did not feel justified in reading into the sub-section a qualification of the power of the Minister to make an order that was not expressed. When the order was made it might be that the authority or undertaker would not be able to get to the water for abstraction purposes unless and until it obtained right of access. As to that he did not feel called upon to express an opinion. All he proposed to do at the present time was to declare that the King George reservoir was a "source" within the meaning of the sub-section.

An Electrical Trades Union Dispute.

MR. JUSTICE TOMLIN, in the Chancery Division on December 11th, had before him a motion on behalf of the officials of the London (East) branch of the Electrical Trades Union for the discharge or variation of an order made on January 30th last on an injunction obtained by the Electrical Trades Union, so as to give the branch officials liberty to make urgent payments out of funds subscribed by the branch members.

Mr. GALBRAITH, K.C., for the branch officials, said there was a dispute between them and the Union, the branch having been suspended on the ground that certain rules had been broken, which was denied. Since the order was made £700 had been contributed by members of the branch, and the question was: Who ought to pay the benefits? There were some members living in West Ham who owing to the dispute could not get the benefits they had paid for and were drawing relief on loan from the Guardians. As a way out of the difficulties he suggested submitting a list of the urgent cases to the head office with a request that they be dealt with.

Mr. NORMAN DAYNES, for the Union, said he did not wish to contend that the effect of the suspension of the branch was to deprive members of the benefits they were entitled to. He was willing to consider the suggestion Mr. Galbraith had made.

His Lordship adjourned the motion until December 15th, to see if the parties could come to some arrangement.

Claim by the Dublin United (Electric) Tramway Co.

MR. GEORGE HEWSON, official arbitrator appointed by the Free State Government, heard evidence recently in the City Hall, Dublin, in respect of a claim by the Dublin United (Electric) Tramway Company for £20,000 for property formerly occupied as offices and stores in Upper O'Connell Street, which the City Commissioners propose to acquire for street-widening purposes. The main portion of the property was destroyed in the insurrectionary fires of 1916 and has since been lying derelict, the company having acquired new premises. Evidence of value was submitted by the company and the Commissioners, the latter's valuation being £2,500. The award will be made in due course.

Bowerman v. Millett.

IN the Mayor's and City of London Court, before Judge Shewell Cooper, on December 10th, Mr. G. Bowerman, importer, Ludgate Hill, E.C., sued Mr. J. Millett, Farringdon Avenue, E.C., radio apparatus dealer, for £12 10s., the price of ten loud speakers. Plaintiff stated that in May last year a case of 24 loud speakers imported from Germany was delivered to the defendant. He had only ordered 12, but as they were packed in cases of 24 the whole case was delivered, and it was arranged that the balance of 12 should be at witness's disposal. As he could not obtain these instruments, he sent in an invoice. Mr. Millett stated that the plaintiff had received the 12 loud speakers in question. The plaintiff had called on a number of occasions and taken them away. Witness took no receipt for the instruments received by the plaintiff as they were plaintiff's own property. Judge Shewell Cooper said there was a direct conflict of evidence between the parties, and it appeared that the plaintiff had taken away the loud speakers and forgotten all about the transaction. He gave judgment for the defendant, with costs.

The Work of the Electricity Commissioners.

The Fifth Annual Report.*

(*Concluded from page* 949).

Generating Stations and Main Transmission Lines.

The aggregate capacity of the generating plant for new stations and extensions of existing stations sanctioned by the Commissioners during the year 1924-25 amounted to approximately 480,000 kW. The rate of provision for meeting the growing demands upon electricity undertakings was thus fully maintained at the figure recorded for the previous year, notwithstanding the continuance of the industrial depression.

Of the 2,244,226 kW of generating plant sanctioned during the past five years, 426,683 kW, or approximately 19 per cent., was for new stations, and 1,817,543 kW or 81 per cent., for the purpose of extending or remodelling existing generating stations. The division of the total for the five years as between the various authorities was approximately as follows:—Local Authority Undertakers, 64.7 per cent.; Company Undertakers, 27.8 per cent.; and Railway and Tramway authorities and non-statutory undertakings, 7.5 per cent.

The capacity of the generating plant sanctioned does not represent a *net* addition to the plant capacity of the country, as in a number of instances the installation of the new plant involved the displacement of other equipment of an obsolete type.

During the year the Commissioners issued 12 consents (6 to authorised undertakers and 6 to non-statutory undertakings) in respect of the establishment of new generating stations, representing an initial installation of plant having a total rated capacity of 16,681 kW.

During the year consents to the extension of existing generating stations were given by the Commissioners to 86 authorised undertakers (92 consents), and 11 further consents were given in respect of the extension of stations owned by railway and tramway authorities and non-statutory undertakings. The sanctioned extensions represent, in aggregate, a plant capacity of approximately 463,200 kW, as compared with the figure of 423,000 kW for the preceding year, the division of the total as between the various authorities being approximately as follows:—Local Authority Undertakers, 299,600 kW; Company Undertakers, 90,600 kW; Railway and Tramway Authorities, 22,700 kW; and Non-statutory undertakings, 50,300 kW.

Under the provisions of the Act of 1919, the Commissioners prescribed or approved of current, frequency and pressure to be used at new private generating stations proposed to be established by seven owners.

The Commissioners dealt with a number of important applications for consent to the establishment of main transmission lines and issued formal consents under the Act of 1919 in respect of 47 applications. A number of the consents related to 33,000-volt transmission lines, and two consents related to 66,000-volt lines, the undertakers being the County of Durham Electric Power Supply Company and the North Wales Power Company, Ltd.

Special Orders.

At the commencement of the period covered by the report, 74 applications for Special Orders relating to the establishment or extension of distribution undertakings were under consideration by the Commissioners, and during the year 88 further applications were received. The Commissioners made Special Orders in respect of 66 of the applications before them. Of the remaining applications, 10 were refused and 7 were withdrawn, leaving 79 applications still under consideration at March 31st, 1925.

As many as 35 of the applications lodged during the year competed, with current or prior applications. Eleven inquiries affecting 17 applications were held by the Commissioners.

Rates (Northumberland) Clause.

During the course of the proceedings in connection with certain applications made by Local Authorities for Special Orders to authorise the supply of electricity, the Commissioners had occasion to consider representations made by large ratepayers, for the insertion of a clause known as the Northumberland or Winchester Clause which provides that on the expiration of a certain period after the commencement of supply, and at definite intervals thereafter, the undertakers shall reconsider and if necessary revise and maintain the scale of prices charged for electricity so that so far as reasonably practicable no contributions from the local rates will be required for defraying the expenses of the undertaking during the succeeding interval. An inquiry was made of all local authority undertakers whose Electric Lighting Orders embodied a clause of the kind in question, with the view of ascertaining their practical experience of the operation of the clause. It transpired that in the majority of cases recourse to the clause had proved unnecessary as the undertakings had been consistently self-supporting. In other cases, however, the undertakers intimated that the existence of the clause in their Order had proved detrimental to development and restrictive in negotiating with consumers. After a full review of all the circumstances, the Commissioners decided normally to disallow the clause when applied for, unless a good case for its inclusion was made out.

General Observations.

The Commissioners, in the interests of future applicants for Special Orders, point out that the rules made by the Commissioners in respect of such applications provide for the submission of a statement of the capital proposed to be expended in establishing the undertaking, and of a report by an electrical engineer on the proposed scheme. The omission to furnish information of the kind in question at the outset has constituted a cause of delay which could have been avoided. Again, adequate consideration has not always been given by the promoters to the possible sources of supply available. The Commissioners require the promoters, in the event of an economic supply proving to be available, to submit a revised engineering scheme based upon such supply. Where applications have related to extensive areas of supply, the Commissioners have found it necessary to ask for a revised scheme when it has appeared to them that the compulsory works proposed to be carried out within two years after the granting of statutory powers, were not adequate or commensurate with the extent and nature of the proposed area. Lastly, there is a tendency to lodge applications, in some instances for extensive schemes, without having previously arranged for the provision of the necessary capital; in such cases the Commissioners are necessarily precluded from proceeding.

Sanction to Borrowing by Local Authorities.

At the commencement of the period covered by the Report, 101 applications from local authorities for sanction to borrowing for electricity purposes were under consideration by the Commissioners, and during the year 596 further applications were received. Sanctions were issued in 562 cases. The total amount of the loans sanctioned during the year was £13,379,060, an increase of about 37 per cent. on the figure of £9,776,593 for the previous year. Plant accounted for £5,725,196 and mains and services for £5,183,942.

Unemployment Grants Committee.

During the year there was an increase (from 60 to 75 per cent.) in the proportion of the wages bill payable by the State in the case of approved schemes financed otherwise than by loan. The number of applications referred by the Committee to the Commissioners for their observations was 153, as compared with a total of 159 in the previous year. The majority of the applications related to schemes for the laying of mains, but several important applications were made in respect of generating plant extensions and alterations of systems of supply. Four schemes submitted by company undertakers were also of an important character, involving an estimated total expenditure of £249,000, chiefly for main transmission lines and distribution works.

Mutual Assistance: Bulk Supplies.

During the past year, further progress was made in regard to bulk supply developments. In the case of the supplies (233) taken from authorised undertakers, the bulk suppliers number 58 local authorities and 32 companies. Notwithstanding the steady progress made in the giving and taking of bulk supplies during the past five years, this class of business still represents a comparatively minor branch of electricity supply in this country. The majority of undertakers prefer to extend their generating stations up to the limit of the capacity of the sites, whether well-adapted or not for modern methods of generation. Little or no regard is given in many cases to the position that will arise when the limited extension, if approved, has achieved its immediate purpose and further provision becomes necessary to meet additional demands. In a number of cases it has appeared to the Commissioners that the ultimate interests of an undertaking would have been better served by the taking of a supply in bulk. It is apparent that accelerated progress under existing conditions is dependent upon the fuller co-operation of authorised undertakers generally.

In addition to 24 other approvals, the Commissioners made Orders permitting a supply of electricity in bulk being given by the Corporation of Edinburgh to the Lothians Electric Power Company, and by the Mersey Power Company, Ltd., to the North Wales Power Company, Ltd. They also approved of the Central Electric Supply Company, Ltd., and the Metropolitan Electric Supply Company, Ltd., and of the Central Electric Supply Company, Ltd., the Kensington and Knightsbridge Electric Lighting Company, Ltd., and the Notting Hill Electric Lighting Company, Ltd., entering into and carrying into effect agreements for their mutual assistance.

D

* H.M. Stationery Office; price 2s. 6d. net.

Alterations of Systems and/or Pressures.

The Commissioners issued 24 consents during the year to alterations in the declared system and/or pressure of the supply hitherto adopted by 23 different authorised undertakers. Further progress was achieved in the direction of the elimination of odd frequencies, seven of the consents being in respect of alterations to the standard frequency of 50 cycles per second from other existing frequencies. In most of the other instances the alterations were from d.c. to 50-cycle a.c. distribution.

Electric Lines and Works of the Postmaster-General.

A conference between representatives of the electricity supply industry and of the General Post Office was convened by the Commissioners in August, 1922, for the purpose of discussing various matters of joint interest. After further consultation with the General Post Office, the Commissioners, in August, 1923, received a communication from the Postmaster-General on the matters discussed at the conference, and a brief summary of the communication is given below.

On the question of the allocation of the cost of the necessary protection of Post Office lines erected subsequently to those of authorised undertakers, the Postmaster-General informed the Commissioners that although he was strictly entitled to recover from the undertakers the full cost of protection, it was the practice of the Post Office in such cases to bear (*a*) half the cost of guard wires or of an alternative such as the erection of insulated wires by the Post Office; (*b*) the whole cost of fuses and heat coils; and (*c*) the whole cost of inserting a layer of concrete between underground power plant and new Post Office plant where the separating distance was less than two inches.

The communication further stated that Parliament had recognised the danger inseparable from the presence of electricity power and supply undertakings (*sic*) on the public roads; had laid down, as a condition for the granting of statutory powers, that precautions must be taken for the safety of other users of the roads; had given specific protection against the injurious affection of telegraphs (including telephones); and had laid on the Board of Trade the duty (now exercisable by the Commissioners) of safeguarding the public; that the erection of guard wires or other protective devices in cases where telegraph or telephone plant was in proximity to the overhead lines of undertakers was essential for the safety of the public and might be regarded as a reasonable insurance by the undertakers against claims for damage to the telegraphs and telephones which might otherwise arise; and that the Postmaster-General regretted that he was unable to recommend to H.M. Treasury any further financial concessions.

With regard to the laying of Post Office mains in proximity to those of authorised undertakers, the Postmaster-General intimated that the Engineer-in-Chief of the Post Office had issued an instruction that the engineers of electricity supply undertakings should be consulted as to the position of their plant and should be informed of the probable date of laying Post Office plant.

Other questions arising in connection with the overhead line regulations of the Commissioners and of the Post Office, respectively, were also dealt with in the communication, and the technical considerations involved were left for further discussion. These matters are awaiting eventual settlement in connection with the revision by the Commissioners of their existing code of regulations for securing the safety of the public and ensuring a regular and efficient supply of electrical energy.

Supplies from Railway, &c., Generating Stations.

Under the provisions of Section 25 of the Electricity (Supply) Act, 1922, the Commissioners, during the year ending March 31st, 1925, issued consents to the undermentioned bodies in respect of the supplies indicated in each case:—

(i) *London and North-Eastern Railway Company.*—Consent was given to a supply of electricity in bulk from the generating station of the railway company to the Corporation of Harwich for the purposes of the undertaking authorised by the Harwich Corporation Electric Lighting Order, 1914.

(ii) *London County Council.*—Consent was given to a supply of electricity from the Greenwich tramway generating station of the London County Council to the London Electric Supply Corporation, Ltd.

Consents to Subscriptions to Associations.

During the year the Commissioners issued consents in respect of the payment of annual or other subscriptions to and/or expenses of attendance at meetings of the British Electrical Development Association (Inc.), the British Engineering Standards Association, the Incorporated Municipal Electrical Association, District Joint Industrial Councils and Joint Boards, electrical displays at Wembley and at the Ideal Home Exhibition, &c.

Advisory Committee on Methods of Charge, &c.

During the year the Commissioners had occasion to give further consideration to the general question of methods of charge and multi-part tariffs, and its bearing as a factor in securing a more extensive development in the use of electricity for domestic purposes. It appeared that an attempt should be made to frame a few model or standard methods of charge, with the view of its being made generally known to authorised undertakers that applications for approval of or for powers to charge by such methods would be favourably entertained in appropriate cases. By the adoption of recognised standard methods, it would only remain to fix the actual quantum (*e.g.*, the particular fixed charge and the particular unit charge in the case of a standard two-part tariff) on the merits of individual applications.

After consultation with the principal associations representative of the electricity supply industry, the Commissioners decided to appoint an Advisory Committee to consider and report upon the question.

Overhead Lines and Wayleaves.

The number of applications for consent to the erection of overhead lines was fully maintained, 162 applications being dealt with by the Commissioners during the year. At the date to which the report is made, the Minister had given his consent in respect of 155 of the applications.

The Commissioners dealt with 12 applications for consent to wayleaves. In the case of the Derbyshire and Nottinghamshire Electric Power Company, consent was given to wayleaves across certain lands in the parish of Morley, the annual rental being fixed by the Minister at 1s. for each 100 yards of cable laid underground; 10s. for each double pole which impeded ploughing operations; 5s. for each double pole which impeded the mowing of grass; and 3s. for each double pole in other cases. Similar conditions were granted to the Leicestershire and Warwickshire Electric Power Company, but in certain cases the annual rentals for double poles were fixed at 8s., 4s., and 2s., respectively, and 6d. for each stay. The North Metropolitan Electric Power Supply Company received consent to wayleaves across certain lands at the rate of 2s. 6d. per pole, and 1s. for each 100 yards of cable laid underground. The North Wales Power Company, Ltd., received consent to a wayleave across certain property at a rental of 2s. per pole.

Organisation and Staff of Electricity Commission.

The volume of work falling to be dealt with by the Commissioners showed a further increase during the year under review. On March 31st, 1925, the staff of the Electricity Commission numbered 54 in all.

At the beginning of the financial year the estimated net cost of administration for the year was £45,550; and the then outstanding liability to H.M. Exchequer in respect of interest on and repayment of advances made to meet the expenses of the Commissioners prior to April 1st, 1922, amounted to £23,450. Allowing for a reduction of £2,000 in the working balance, the total amount to be apportioned among authorised undertakers was therefore £67,000, and this estimate was approved by the Minister. The apportionments in respect of the estimate were made on authorised undertakers in June, 1924, the contributions by the electricity supply industry towards the expenses of the Commissioners for 1924-25, inclusive of repayment to H.M. Exchequer, involving a payment by each authorised undertaker concerned amounting to 3.7d. per 1,000 kWh sold.

The actual net expenditure on administration during 1924-25, including the special expenses incurred by the Commissioners in connection with the report on Standardisation of Frequency (£4,206), was £43,520, a net saving of £2,030 on the total estimate, due partly to the sustained increase in the number of applications for Special Orders. The liability of the Commissioners in respect of advances from H.M. Exchequer was finally discharged during the year.

In concluding the report, the Commissioners record, with regret, the retirement of their colleague, Mr. Harry Booth, O.B.E., from the office of Electricity Commissioner on January 24th, 1925, after five years of service in that capacity and after completing over 40 years in all in the public service.

Fifteen appendices and two maps are attached to the report.

London's Electricity Supply in 1923-24.

The L.C.C. Annual Report.

(*Concluded from page* 956.)

In our last issue we dealt with those sections of the report relating to the capacity, output and finances of municipal and company undertakings; in this part we deal mainly with charges to consumers, a subject which occupies twelve pages of the report and presents infinite variety.

No fewer than 22 methods of charging are in vogue and these methods are applied in various ways by different authorities. Generally, it may be said that there are four main methods of charging for electricity:—(i) The flat-rate system; (ii) the sliding-scale system, whereby the rate decreases as the consumption rises; (iii) the maximum demand system, by which the equivalent of so many hours' use of the maximum demand is charged for at a relatively high rate, with a smaller charge for further consumption; (iv) the "telephone" system, comprising a fixed annual or quarterly charge, based on the size and character of the installation or upon the rateable value of the premises, with a low "unit" rate for energy consumed. Other less common methods employed are:—(v) The two-rate

system, involving the use of a time switch, whereby energy consumed during certain hours is charged for at a lower rate than during the rest of the day; (vi) the prepayment-meter system; and (vii) the contract-tariff system whereby the charges are determined solely by the installation without regard to actual consumption. There are only two examples of the last system in London; these are Barnes, where the rate is based on the number and size of lamps, and Hammersmith, for power, in respect of 100 per cent. load factor devices.

It may be said at once that true comparisons between the rates charged by various undertakings are well-nigh impossible; the nearest approach to accuracy is made by comparing flat rates, and in this connection it is considered permissible to include the first steps of sliding scales, it being argued that proportionately few consumers ever reach the further steps. On this basis a table has been compiled showing the flat rate charges for lighting of 85 undertakings, or sections of undertakings where large companies make different charges in various parts of their areas. From the table it is seen that the upper and lower limits were 1s. per kWh (Leatherhead and Caterham (Urban Co.)), and 4d. per kWh (Battersea, Hampstead, Hendon, and St. Pancras). The average flat-rate of the 85 undertakings was 6.9d. per kWh. In the preceding year, although the maximum and minimum rates were the same, the average rate for 83 undertakings was 7.17d. per kWh, so that the latest figures show a decrease of 0.21d. per kWh in the average lighting charge. In the case of power charges a similar table has been prepared and 72 undertakings are set out in this. The highest rate was 7d. per kWh, representing the first step of sliding scales in force at Bromley (Kent), Chislehurst, Dorking (Edmundson's), Twickenham and Teddington, and Walton and Weybridge (Urban Co.). The lowest rate was 1d. per kWh (Hampstead and St. Pancras). The average rate for power charged by the 72 undertakings was 2.95d. per kWh. In 1922-23 the charges were bounded by the same limits, but the average was 3.6d. per kWh; thus the latest figures record a decrease of 0.65d. per kWh. In a similar statement in connection with flat-rate charges for heating and cooking, 85 undertakings are tabulated. In this case the maximum rate was 6d. per kWh (Dorking), the minimum rate 1d. per kWh (twelve undertakings), and the average rate 2.2d. per kWh (approx.). The average rate for the same number of undertakings in 1922-23 was 2.42d. per kWh. Therefore, assuming that these flat rates give some indication of the general tendency of prices, it will be seen that the average lighting rate was reduced by about 3 per cent., the power rate by 18 per cent., and the heating and cooking rate by 9 per cent.

The actual effect of the other systems dealt with cannot, of course, be gauged from the mere figures showing the basic and other charges instituted. In addition to varying their charges, many undertakings adopt special conditions, compliance with which secures to the consumer a lower rate. For instance, in Wimbledon energy for water heaters is charged for at approximately ¾d. per kWh, provided the total consumption for heating and cooking is not less than 150 kWh per quarter. Two or three undertakings allow power consumers to use a percentage of their power consumption for lighting purposes. The Brompton & Kensington Co. has instituted a lower lighting rate for private-house basements. Many authorities have special rates for institutions of various kinds, shop lighting, electric signs, &c.

Following this section is a table showing the assessments for the rating purposes of the London undertakings; this gives the rateable value of municipal undertakings as £135,409, and that of the company undertakings as £429,524, making a total of £564,863. The final part of the report proper gives the total number of kWh sold by each undertaking in 1913-14 and each year from 1917-18 to 1923-24. Complete figures for the extra-London companies are not available, but the total sales of the municipalities and the London companies are seen to have risen from 408,542,070 kWh in 1913-14 to 792,619,083 kWh in 1923-24.

A new feature of this report is an appendix which gives later figures for the company undertakings than those given in the body of the report, *i.e.*, for the year ended December 31st, 1924.

These figures may be briefly summarised as follows:—Plant capacity at the end of the year 452,480 kW generating and 98,431 kW transforming; maximum demand 344,057 kW; load factor, 21.4 per cent.; total energy generated, 659,407,609 kWh; total energy sold, 522,531,986 kWh; net capital expenditure, £28,968,474; total revenue, £6,624,761; working expenditure, £2,688,010; available for capital charges, £3,901,960; capital charges, £3,869,484. The last figure is incomplete.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Christmas Holidays.—The ELECTRICAL REVIEW for December 25th will appear one day in advance of the usual time of publication owing to the Christmas holidays. The attention of contributors and advertisers is therefore directed to the announcements to this effect published in our last issue, as by the time this notice is in the reader's hands the preparation of the next issue must be in a forward state.

The "Electrical Review" Index.—The Index to Vol. XCVII (for the half-year ending December 31st, 1925) will be published shortly, and we shall be glad to receive the names and addresses of those who require it (free of charge) for binding purposes or wish to retain it for reference. Application should be made as early as possible to the Publisher, 4, Ludgate Hill, E.C.4.

"The" Wireless Exhibition of 1926.—With reference to our several editorial comments regarding the undesirability of too many wireless trade exhibitions being organised for next year, we are pleased to be able to give publicity to an announcement received from the National Association of Radio Manufacturers and Traders.

That Association has concluded negotiations for the holding of a wireless exhibition in 1926, which will be open alike to members and non-members of N.A.R.M.A.T. Further statements regarding the matter will be issued from time to time.

The British Industries Fair.—In order that buyers may be afforded every possible facility, the Government has decided that holders of the official invitation cards may have their passports to England visaed without any charge being made. Invitations to visit the Fair are being issued to all firms abroad whose names are on the Department's index and to any other firms suggested by exhibitors. In addition, the British Government extends a general invitation to all overseas buyers to visit the Fair. Invitation cards may be obtained from the nearest British Consul or from the Department of Overseas Trade, 35, Old Queen Street, S.W.1.

Lead.—Messrs. James Forster & Co. state that a further cut in the American price on December 8th of about 25s. per ton caused a further fall here. With a prospect of larger supplies from America in the near future, they are inclined to think that prices will go lower yet. The Board of Trade returns for November were:—Imports, 19,943; exports, 2,563; leaving for home consumption 17,380 tons.

Birmingham Electric Club.—At its annual meeting to-day the report for the 1925 session is to be presented by the committee. The total membership is now 213 as against 183 a year ago. The attendance at the club meetings varied from 41 to 136 and averaged 65 compared with 62 in the previous session.

The North-Western District Council.—The annual conference of authorised undertakers in the North-Western Area was held at the Manchester Town Hall on December 8th for the purpose of reviewing the work of the past year and electing employers' representatives for the District Joint Industrial Council (No. 3) and the District Joint Board of Employers and Staff Members. Mr. A. H. Banks, the employers' secretary, has sent us a statement showing the grouping of the undertakings and the names of re-elected representatives.

The International Glow Lamp Syndicate. — It is stated that the members of the International Glow Lamp Syndicate will meet at Berne in the near future to decide on the question of the standardisation of glow lamps throughout the world in order to simplify production and also possibly to reduce the sale prices. In this connection some further information has become available concerning the recent statements made by Dr. Meinhardt of the German Osram Company, to which reference was made in our issue of December 11th. It appears that the superstructure of the international glow-lamp agreement is formed by the Phoebus, A.G. für Industrielle Entwicklung des Beleuchtungs Wesen, which is the covering company of the whole organisation that has been established in Geneva, because Switzerland has not yet concerned itself with legislative measures restricting the activities of syndicates. In the countries represented by the syndicate, sales are independently regulated according to the turnover and the share of the country in the business. The other countries are common territories and for these allotments are arranged in a chosen year according to the sales of the interested glow lamp industries. It is, however, provided that makers who have obtained a special footing in definite markets shall not lose the advantages of their labours.

A South-Western Lighting Service Bureau.—On December 2nd a meeting was held in Cardiff to discuss the formation of a Lighting Service Bureau to serve the interests of the industry in the South-Western area. Many engineers representing supply authorities were present, in addition to representatives of the wholesalers and electrical contractors. A resolution expressing the desirability of starting a Bureau was carried unanimously, and a sub-committee of the various interests was formed in order to go fully into the details of the scheme.

Profits of German Electricity Undertakings. — The *Eletrische Betrieb*, in a recent issue, gave the results for the past financial year of 54 electricity supply undertakings in Germany, which showed an average dividend to the shareholders of 6.25 per cent., as compared with an average of only 4.3 per cent. for German industrial undertakings. Only seven of the 54 concerns failed to pay a dividend.

Trade Announcements.—MESSRS. FRANK A. SMITH, LTD., radio specialists, have opened new premises at 27, High Street, Stourbridge.

MR. F. WARREN, of the Radio Works, Dallow Road, Luton, has opened additional premises at 8, Gordon Street in that town.

MR. GARDINER, radio dealer, of Dumfries, has removed his business to 95, Friars' Vennel.

MR. C. BERNARD DAY, radio engineer, has commenced business at 10a, St. Andrew's Street, Bury St. Edmunds.

THE LIGHTING, HEATING & TRACTION SUPPLIES CO. has removed from 43 to 51, Doughty Street, W.C.1.

As some of their trade cards have been presented by unknown persons without authority, MESSRS. L. G. HAWKINS AND CO., LTD., of London and Glasgow, wish to inform the trade that they will only be responsible for goods supplied to them against their definite official order duly signed.

THE AUTO ELECTRICAL SERVICE CO. has opened a depôt at 519, Green Lane, Goodmayes, Ilford.

Book Notices. — "Electrical Engineering Problems." Part I. By John G. Pertsch. Pp. viii+213; figs. 100. London: McGraw-Hill Publishing Co., Ltd.—This volume contains problems on the fundamental relations in electrical and magnetic circuits and their application to d.c. machinery. Conversion and copper-wire tables, and also resistance computation constants are given in appendices.

"Circular of the U.S.A. Bureau of Standards No. 232," July, 1925; No. 276, August, 1925 (20 cents).

"Technologic Papers of the U.S.A. Bureau of Standards." Nos. 286 (10 cents), 288 (10 cents), and 289 (20 cents). June, 1925.

"Scientific Paper of the U.S.A. Bureau of Standards No. 508." June, 1925 (20 cents).

"Yallourn and the Associated State Electricity Schemes." Melbourne: *Australasian Electrical Times*. 6s., post free.

"Alternating-Current Circuits," by J. M. Briant, M.S., E.E., and J. A. Correll, M.S. Pp. xii+412; figs. 289. London: McGraw-Hill Publishing Co., Ltd. Price 20s. net.

Catalogues and Lists.—THE LONDON FACTORS & AGENTS, LTD., 38 and 39, Parliament Street, S.W.1.—A comprehensive catalogue of electrical material, accessories and appliances.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 and 39, Upper Thames Street, E.C.4.—Catalogue No. 97, containing illustrated details of shades, bowls and reflectors; Leaflet No. 147, advertising "Siemens" neon lamps; and Leaflet No. 146, dealing with electric lamp outfits for decorative purposes.

THE ELECTRIC HEATING CO., George Street, Croydon.—An illustrated and priced booklet dealing with "Elect" irons and other domestic appliances.

MR. ALAN WRIGHT, Sentinel House, Southampton Road, W.C.1.—A pamphlet illustrating a number of "Inventum" appliances suitable for Christmas gifts. Priced.

MESSRS. FREDERICK BRABY & CO., LTD., Petershill Road, Glasgow.—A booklet advertising "Venteolite" galvanised sheets for ventilating purposes.

MESSRS. ERSKINE, HEAP & CO., LTD., Room 607, Australia House, Strand, W.C.2.—Pamphlet TCC.1, containing illustrated details of the company's truck type cubicle switchgear.

N-K, LTD., 111, Great Portland Street, W.1.—An illustrated pamphlet advertising "Daenite" electric signs.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, New Oxford Street, W.1.—An adhesive coloured paper cut-out advertising "Mazda" lamps.

MESSRS. A. J. STEVENS & CO. (1914), LTD., Walsall Street, Wolverhampton.—A well-produced coloured showcard depicting one of the company's cabinet radio receivers.

MESSRS. R. JENKINS & CO., LTD., Rotherham.—A collection of illustrations of a number of welded products produced by the company.

PHILIPS LAMPS, LTD., 60, Wilson Street, Finsbury Square, E.C.2.—A folder advertising the "Savelite," an a.c. incandescent lamp of very low wattage.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A mailing card bearing illustrations and prices of "Gecophone" receiving sets and headphones. Also the December "Osram Bulletin," containing notes and news of "Osram" lamps and valves.

FULLER'S UNITED ELECTRIC WORKS, LTD., Woodland Works, Chadwell Heath, Essex.—An illustrated publication treating of the company's train-lighting batteries.

THE LANCASHIRE DYNAMO & MOTOR CO., LTD., Trafford Park, Manchester.—Descriptive List 465, containing full, illustrated particulars of "Crypto" constant-potential battery-charging equipment—a.c. and d.c. Priced.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—Publications Nos. 364F and 438, dealing with "Marconiphone" and "Sterling" radio receivers, accessories, and components. Illustrated and priced.

THE LODGE FITTINGS CO., LTD., 57, Albert Road, Aston, Birmingham.—An illustrated and priced pamphlet dealing with "Classic" desk, &c., lighting fittings.

THE MIRRLEES WATSON CO., LTD., Scotland Street, Glasgow.—Publication No. Pu.10, containing an illustrated description of a surface condensing plant recently installed at a spinning mill at Ballymena, Ireland. Also Pamphlet No. S.515, describing the company's feed water evaporators.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—December stock list of motors and dynamos.

METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester.—Catalogue (Section M), dealing with domestic electrical appliances. The range covered is a very wide one, and full details illustrations, and prices are given. Also two smaller booklets entitled "Cosmos Home Helps" and "Home Helps for Christmas," containing details of domestic appliances.

THE RAY ENGINEERING CO., LTD., Frogmore Street, Bristol.—Publication B.S.1, containing illustrated details and prices of battery switchboards.

Bankruptcy Proceedings.—W. A. A. C. ROBINSON, 10 Carnaby Street, Golden Square, W., electrical engineer.—The application of this bankrupt for an order of discharge came before Mr. Registrar Mellor on December 8th at the London Bankruptcy Court. The Official Receiver reported that the applicant failed last July with ranking liabilities of £443 and assets which had realised £9. He was employed as a charge engineer at a salary of £350 p.a., but resigned the post owing to his financial difficulties. The discharge was suspended for two years on statutory grounds.

E. H. NEWMAN (trading as Newman & Co.), radio and electrical engineer, Shepherd's Bush Green, W.—The first meeting of creditors was held on December 10th at the London Bankruptcy Court, when the Official Receiver reported that the liabilities were roughly estimated at £700 and the assets were valued at £20. The debtor had stated in the course of his preliminary examination that he had carried on the above business in part ownership with his wife. During the war he served as a wireless operator with the Naval Forces. In September, 1923, he obtained the post of salesman to a radio company, and in June of the following year he assisted in the formation of the Radio Electrical Co., Ltd., of which he was appointed the managing director. But it was not a success and it had gone into voluntary liquidation. During the period of his directorship he was also acting as manager of a works controlled by the liquidator of another radio company, and in January last, in partnership with his wife, he began the business of Newman & Co. That business mainly consisted of employing travellers on a commission basis for the purpose of selling radio accessories to shops and dealers, and it had probably never been a success in consequence of heavy overhead expenses and lack of capital. Recently his credit had been stopped, and creditors had taken legal proceedings against him. He obtained several adjournments of the petition in bankruptcy in the hope of his being able to form a company to take over his assets and his liabilities, but nothing definite had yet matured. In the absence of any resolution the estate remained in the hands of the Official Receiver.

JOHN MUNRO and JOHN MUNRO & CO., electrical engineers and plumbers, 45, York Place, Edinburgh.—A dividend will be payable on January 21st at the office of Messrs. W. J. A. Drummond & Lessels, 10, Stafford Street, Edinburgh.

J. BRODIE, electrical engineer, 59, High Street, Dunfermline.—A meeting to elect a Trustee and Commissioner was to be held yesterday, December 17th, at the D.C.I. Rooms, Bonnar Street, Dunfermline. Agent, Mr. J. W. Sterling, 77, Queen Anne Street, Dunfermline.

T. BARTON, electrical engineer, The Electric Works, Ainsworth Street, Blackburn.—Last day for proofs for dividend, December 24th. Trustee, Mr. A. T. Eaves, 47, Mosley Street, Manchester.

J. MITCHELL and F. MITCHELL (F. Mitchell & Co.), electrical engineers, 97, Stockport Road, Ardwick, and 58, Ashton Old Road, Openshaw, Manchester.—First and final dividend of 4s. 4½d. in the £, payable at the Official Receiver's offices, Byrom Street, Manchester.

J. R. PATTISON, electrical supplies factor, 15, Goldsmith Street, Nottingham.—First and final dividend of 1s. 7¾d. in the £, payable December 18th, at the Official Receiver's offices, 4, Castle Place, Nottingham.

H. L. WOOD, electrical engineer, late of Elm Grove, Southsea.—Receiving order made December 1st, on debtor's own petition.

E. O. HENSTOCK, electrical engineer, 21, Old Road, Brampton, Chesterfield.—First meeting, December 18th, at the Official Receiver's offices, 4, Castle Place, Nottingham; public examination, January 15th, at the County Court, Chesterfield.

W. R. GRIGSBY (Wenham Lighting Corporation), electrical factor, late of 184, Gray's Inn Road, W.C.—Last day for proofs for dividend, December 28th. Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.

M. D. ROSENBLOOM (D. Rose & Co.), electrical engineer, 25, Osborn Street, E.—Last day for proofs for dividend, December 28th. Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.

Company Liquidations.—MORGAN WESTON, LTD., 38, Great Russell Street, W.C.1, radio and electrical dealers.—A meeting of creditors was held recently, at the offices of Messrs. Oscar Berry & Co, C.A. A statement of affairs was presented which showed liabilities of £1,353, all due to unsecured trade creditors. The assets were estimated at £462, leaving a deficiency of £891. It was reported that the company was incorporated on October 14th, 1924, with a nominal capital of £500, principally to carry on business in radio, electrical, and similar goods, and for that purpose an agreement was entered into with Nancy Cope to purchase a business carried on by her at Houndsditch, and in consideration she received 498 fully paid ordinary shares in the company. The first directors were N. Cope and V. E. Cope. Mr. V. E. Cope was appointed managing director at a salary of £500. In December, 1924, the company granted a debenture for £400 to Messrs. Merchants & Agencies, Ltd., in consideration for goods supplied to the company. Further financial assistance was given by

rchants & Agencies, Ltd., in June this year, and an agreeent was entered into whereby Merchants & Agencies, Ltd., ured the right to nominate a director of the company, which ndertook to buy all high-pressure batteries from Merchants d Agencies, Ltd. In June Mr. V. E. Cope vacated his sition on the board, and Mr. W. H. Harper and Mr. V. chards were appointed directors. In July the capital was creased to £2,000, and 1,500 additional shares of £1 each ere issued to Mr. Harper as nominee of Merchants and gencies, Ltd., and the amount owing to that company was ereby reduced by £1,500. As the result of pressure from e two largest creditors the company went into voluntary quidation on November 23rd. It was stated that the books the company were in a very unsatisfactory condition, and had been difficult therefore to gauge the real financial sition. The figures placed before the company on November rd last showed a trading loss of over £400. No resolutions ere passed, and the matter remains in the hands of Mr. scar Berry as liquidator.

The creditors include :—

"Ahems" Werkstatten (Berlin) £665; Merchants & Agencies, Ltd. £549.

Engineering Industry, Ltd.—A meeting of members is lled for January 14th at Sardinia House, Sardinia Street, ingsway, W.C., to hear an account of the winding up from ne liquidator, Mr. H. N. Hare.

Private Arrangements. — W. W. Symper and D. J. vershed, trading as Symper & Evershed, 22-24, Greenhill arade, Harrow, electrical and radio contractors.—According a circular issued by the British Traders' Association, a meetng of creditors was held on November 13th, but no resolutions ere passed. Subsequently, however, it was possible, by conent of the largest creditors, for the debtors to execute a deed f assignment to Mr. W. Osborne on December 2nd. A revised tatement of affairs had been prepared, showing that the defiiency was more than explained by the writing down of the ssets. The business was commenced by Mr. Symper in 1918 n borrowed capital, and two years afterwards Mr. Evershed oined him, introducing £500. Certain accounts were prepared p to May, 1924, which disclosed a substantial profit. From une, 1924, to October 31st, 1925, there was a small profit, but fter allowing for the joint drawing of the debtors, a loss was nade. The statement of affairs attached to the circular shows iabilities of £2,647, and net assets of £1,779, leaving a defiiency of £868. By direction of the largest creditors, arrangements will be made to continue the business for a few weeks, o that either partner can make endeavours to introduce a uyer. The committee acting with the trustee comprises a epresentative of Messrs. Falk, Stadelmann & Co., Ltd., Mr. . F. Thomas (General Electric Co., Ltd.), Mr. Martin (Vulcan Electric Co., Ltd.), and Mr. Lightstone (Ever Ready Co. (Gt. Britain), Ltd.). The following are creditors :—

	£		£
Cable Accessories Co., Ltd. ...	40	Metropolitan-Vickers Electrical	
Crabtree, J. A., & Co.	72	Co., Ltd.	90
Dickison & Sons, Ltd.	24	Marconiphone Co., Ltd.	25

The Engineering Industry and Foreign Competition.—*The Times* states that arrangements have been made for the adjourned conference between the Minister of Labour and representatives of the Engineering Employers' Federation and the engineering unions, on the question of foreign competition, to be held on December 21st. The employers and the unions have joined in a request to the Government to take steps under the Peace Treaty or otherwise to secure an arrangement whereby the working hours of competitor nations on the Continent may be brought into reasonable relation with the working week in this country. The Minister of Labour at the last interview promised to consider the points raised, and it is expected that on Monday next he will give the reply of the Government.

The Newcastle Supply Co.'s New Premises.—Much interest has been aroused by the building activities lately begun on the site of the old Turkish Baths, at the corner of Pilgrim Street and New Market Street, Newcastle-upon-Tyne. The building, which is to be ready for occupation in the autumn of 1927, is destined to be the northern headquarters of the electrical industry, and has become a necessity in view of the developments in recent years in the business of the Newcastle-upon-Tyne Electric Supply Company, Ltd., and its associated companies. This group is at present housed in five different places in Newcastle, having completely outgrown its registered offices in Hood Street, into which it moved in 1904. The concentration of the staff in one building will ensure increased efficiency and economies in working, and in the administration of the large area throughout which the company now supplies electricity. In addition to the staff of the supply companies, others will also be accommodated in the building. Messrs. Merz & McLellan, the consulting engineers to the companies, have arranged to occupy a portion of the new building, and any further space in the building which may be available will, in all probability, be occupied by electrical manufacturers or others concerned in the industry. Carliol House, as the new block is to be called, may in effect, therefore, become the main headquarters of the electrical industry in the North of England. The building has been designed by Mr. L. J. Couves, Newcastle-upon-Tyne, in conjunction with Sir John Burnet & Partners, of London. Mr. Couves made a special journey to the United States for the purpose of studying the most-up-to-date methods of planning and equipping large office buildings. The site chosen—which is a commanding one in the business centre of the city—has a ground area of 28,000 sq. ft. and a frontage in New Market Street of 432 ft. The building over about one half of the site will consist of eight floors, and, on the remainder, nine floors including the basements will be erected. There will be two entrances; one in New Market Street, and the other at the corner of Pilgrim Street and New Market Street. The latter will open into a

The Newcastle Supply Co.'s New Premises.

rotunda or circular hall, which will form part of the showrooms. These showrooms, which will be a special feature, will provide ample space for consumers to see electrical appliances in actual use. The lighting arrangements will be of the most modern type. A well-arranged basement on the eastern half of the premises will provide for the central heating and vacuum cleaning plants. Central heating will be provided by means of a low-pressure hot water system, which is to be heated electrically. The vacuum cleaning plant will be wholly electrical. The New Market Street entrance will give access, through an imposing hall, to a well-lighted staircase with four high-speed elevators to the offices above. Each floor will be divided into suites of offices, which have been specially planned to make for efficient working. The contractors carrying out the erection of the building are Messrs. Stephen Easten, Ltd., Milburn House, Newcastle-upon-Tyne.

New French Company.—La Société Nerka is the name of a new company which has lately been formed in Paris (21, Rue de Peletier) with a capital of 400,000 fr., to manufacture "Nerka" sparking plugs for motor vehicles.

Clock Electrification.—The clock with four dials each 26 ft. in diameter, in the tower of the Singer Buildings at Clydebank, Glasgow, is claimed to be the largest in the British Empire, and it is interesting to note that this clock has succumbed at last to modern methods, and the mechanical movement is being replaced by an electric time-keeper. A "waiting-train" movement similar to that driving the Liver Clock at Liverpool is being fixed by the patentees—Messrs. Gent & Co., Ltd., Leicester—the order having been received through their Scottish agents, Messrs. Edward & Son, Ltd., Glasgow.

French Foreign Electrical Trade.—The appended table shows the value of the French imports and exports of electrical machinery and apparatus during the seven months ended with July last, as compared with the corresponding period of 1924 :—

	Imports.		*Exports.*	
	January to July.		January to July.	
	1925.	1924.	1925.	1924.
	1,000 fr.	1,000 fr.	1,000 fr.	1,000 fr.

Totals (1,000 fr.) ...	111,307	109,295	191,863	216,554

Fire.—The fire that recently occurred at the G.E.C. conduit works (The Oriental Tube Co., Ltd., West Bromwich) will not affect the delivery service of the General Electric Co., Ltd.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report, December 15th :—Copper (electrolytic), £65 10s., 15s. dec.; ditto, ditto sheets, no change; ditto, ditto wire rods, £75 10s., 15s. dec.; ditto, ditto, h.c. wire, 9½d., 1/16d. dec.

Messrs. James & Shakespeare report, December 15th :—Copper bars (best selected), sheet and rod, £90, £2 dec.; English pig lead, £35 5s., 15s. dec.

Messrs. Edward Till & Co. report, December 15th :—India-rubber, Para, fine, 4s. 5d., 1d. dec.

The Electricians' Wage Claim.—The apparently quiescent question of wages in the electricity supply industry was carried a stage further on December 9th. It will be remembered that a claim for an extra 10s. a week was put forward some months ago, and the men then resolved by ballot to take strike action if a satisfactory reply was not made to their claim. On December 9th it was decided to form a joint appeal board consisting of six representatives of each party, with an independent chairman; Mr. C. P. Sparks was unanimously elected to the position. The decision of this board is to be accepted by the parties to the claim, and it is stated that the first meeting will be held after Christmas.

E.D.A. Activities.—We are pleased to learn that the Britisn Electrical Development Association is again to arrange a display of electricity in the home at next year's Ideal Home Exhibition at Olympia (March 2nd to 27th). The Association's exhibit at Olympia last March proved one of the greatest attractions and no fewer than 17,000 people paid a visit to the "Electric House."

Chinese Notes.—*The Chinese Economic Bulletin* states that the supply of electricity in Hankow, with the exception of the foreign concessions, is in the hands of the Hankow Waterworks & Electric Light Co., Ltd. The demand for electricity has grown rapidly and last year the company extended the supply to Hanyang across the Han River.

The authorities in Nanking, Kiangsu province, are building a radio station to communicate directly with Tientsin and Mukden

The Shantung authorities are installing a long-distance telephone system "to facilitate the work of bandit suppression."

The radio station at Yunnanfu, Yunnan province, is now open for public business.

The Shansi authorities have decided to construct a radio station at Linfeng (formerly Pingyangfu).

Coloured Decorative Lamps.—THE GENERAL ELECTRIC CO., LTD., has issued a pamphlet containing illustrations in colour of the huge signs erected by Messrs. Lewis at their Birmingham, Liverpool and Manchester establishments. These show very effectively the results obtained by the use of "Osram" colour-sprayed lamps.

Dissolution of Partnership.—VLASTO, CLARK & WATSON, electrical engineers, London Road Bridge, Stockton Heath, Cheshire.—Messrs. I. Vlasto, T. Clark, and W. Watson have dissolved partnership. Messrs. Vlasto and Clark will attend to debts and continue the business.

The Hackney Showrooms.—At a meeting of the Hackney and Stoke Newington Chamber of Commerce, last week, Mr. A. C. Bostell, A.M.I.E.E., sales manager of the Hackney electricity undertaking, introduced a scheme whereby the four empty showcases in the Lecture Hall of the undertaking are to be allotted in turn to members of the Chamber of Commerce, who will dress them and maintain them for one month. The lighting will be supplied free. The shopkeepers will pay an entrance fee, and three prizes will be awarded by public ballot. A prize will also be awarded to the person who accurately guesses the total number of votes recorded. Sir Herbert Ormond, J.P., offered a challenge cup for the best dressed case of the year. The scheme was adopted and a committee formed to arrange details. Mr. L. L. Robinson, borough electrical engineer, said that the showrooms and demonstration halls had been successful beyond their expectations; each day from eighty to one hundred people visited them, and on Saturday evening the number often reached a thousand. Already the sales were up 400 per cent.

The D.O.T. Commended.—In the course of a speech which he delivered at a dinner attended by the directors and sales representatives of Agricultural & General Engineers, Ltd., the chairman of the company (Mr. G. E. Rowland) paid a tribute to the Department of Overseas Trade. He urged sales representatives to direct their attention particularly to export trade and advised them to avail themselves of the services of the D.O.T. He said that he was surprised at the organisation of the Department; it was in a position to give a great deal of information to those who approached it.

A German Osram Lamp Loan. — The German newspapers state that the Osram Co. has concluded a loan of 5,000,000 dollars, with a currency of 25 years, with the Amsterdam Bank and other Dutch institutions, the Stockholm Enskilda Bank, and Lazard Bros., of London. The rate of interest is 7 per cent., and the loan is said to be guaranteed by the Berlin A.E.G. and the Siemens & Halske Co. Apart from the recent Berlin municipal electricity loan, the new loan is the first to be raised in the European market. The proceeds are intended for further improving the works of the company and for the establishment of a new glass factory.

The Canadian Radio Industry.—In the course of a note upon trade conditions in Canada, *Reuter's Trade Service* (Ottawa) says that Canadian manufacturers of amateur radio equipment are enjoying unprecedented prosperity, and at least one large firm has been forced to decline to accept any further orders until after the New Year.

Local Exhibition.—BLACKPOOL.—The Electricity Department has organised an electrical exhibition at the Winter Gardens, where a special display has been made of electrical bread-baking devices. Each member of the trade in the district has received an invitation to inspect the new apparatus.

Calendars, Diaries, &c.—In its calendar for 1926 the NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO. retains the black and gold style which has distinguished its past calendars. Weekly date slips are provided and each of these has a calendar for the current month at its foot.

MESSRS. ARTHURS, Charing Cross Road, W.C., have placed a humorous drawing (a "doggy" cat) on their 1926 calendar, of which we have received a copy.

From Mr. CHARLES SELZ, of 83, George Street, Baker Street, London, W.1, we have received a small pocket diary for 1926 with season ticket pocket, &c.

MESSRS. MATHER BROS., of 36, Farringdon Street, London, E.C.4. have sent us a wall calendar for 1926 with monthly slips and a date indicator.

MESSRS. FRANCIS POLDEN & Co., LTD., have sent us a useful wall calendar with monthly slips and a date-marking device.

The calendar received from the HART ACCUMULATOR CO., LTD., has extra large monthly sheets with 1¾-in. figuring which makes it suitable for the wall of a large office or shop. The company has also sent us, as usual, a desk blotting pad, each sheet of which bears a calendar for the year.

MR. L. W. FOOTE, of 30, Charles Street, Cardiff, has issued a wall calendar with monthly slips fixed below a reproduction of a charming water-colour "Flowers of the Sea."

The very neat and serviceable pocket diary of MESSRS. SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham, which has been our constant companion during 1925 because of its convenient space arrangement, will shortly give place to the 1926 one just received.

MESSRS. L. MCMICHAEL, LTD., have sent us an ash-tray with a match holder (or it may be a candlestick) in glazed earthenware. The match holder is a reproduction of one of the company's h.f. plug-in transformers.

MESSRS. PRITCHETT & GOLD & E. P. S. Co., LTD., of 50, Grosvenor Gardens, S.W.1, are sending out as a Christmas souvenir a large desk ash tray moulded in "Dagenite," the special composition used in the manufacture of containers for the company's portable batteries. Trade readers who wish to receive one of these trays are invited to apply to the company.

The "Tungstone" Accumulator.—We have received particulars of a new lead storage battery, of British design and manufacture, known as the "Tungstone" accumulator, in which the grids are made and pasted wholly by machinery. The pure lead grids are die-cast in small sections, which are joined together by a small proportion of antimonial lead fed under pressure into recesses between the sections. It is claimed that, thanks to the greater volume of pure lead present in the battery, the Tungstone plate has a higher amperage capacity and lower weight, together with longer life, than any other type of plate. Various patterns are made, for car starting, lighting, and ignition, for the high-pressure batteries of wireless apparatus, &c. The distributors are the Tungstone Accumulator Co., Ltd., of 3, St. Bride's House, Salisbury Square, E.C.4.

Social Events. — The annual dinner of the staff of the Osram-G.E.C. Lamp Works and the M.O. Valve Works (General Electric Co., Ltd.), was held at the Café Royal on December 12th, under the chairmanship of Mr. Chris. Wilson. After an excellent repast and the toast of the King, the chairman offered Sir Hugo Hirst, Bart., the congratulations of those present upon the honour conferred upon him by the King; he said that they felt that it was an honour done to them all. Mr. J. J. Gracie, proposing the toast of "The G.E.C.," said that the most remarkable thing about the company had been its rapid rise from small beginnings to a position of great importance. Two reasons for its growth had been its adaptability to needs as they arose, and the way in which the production and sales sides worked together as a unit.

Sir Hugo Hirst, in reply, spoke of the efforts which had been made to secure good conditions for the staff. He also said that the directors had been through the necessary experience and knew exactly what they should do. The depreciation of foreign currencies had rendered it necessary to seek international agreements to secure the safety of the company. Sir Hugo said that the country was still in an unhappy state; a very large organisation had just found it necessary to write down its capital and close certain branches, and he feared that others might follow suit with consequent unemployment and reduced purchasing power. The G.E.C. benefited by the diversity of its products. Dealing with the question of wages, the speaker said that the high rates paid in sheltered industries had led to discontent among skilled workers. Unless conditions were brought into a sane and sound condition we should be overwhelmed by foreign competition. He hoped, however, that things would turn out well and that electricity would save the country.

Mr. G. Cheliotti, in a humorous speech, proposed the toast of "The Visitors," and referred to the joint efforts of the works and sales staffs which had resulted in record sales of the company's lamps and valves.

Mr. F. Crawford, manager of the Liverpool branch, replied —partly in verse—and Mr. J. Y. Fletcher followed. The latter, referring to the fact that he was to be the next chairman of the Electric Lamp Manufacturers' Association, said that he hoped the works would soon be better represented on that body. With regard to the company's output, he said that export trade was of vital importance; they hoped soon to reach the position when one out of each pair of lamps produced would be sent abroad. In this connection he referred to international agreements, and said that he hoped that soon the General Patent and Business Development Association—"the

Locarno of the lamp industry"—would soon be functioning. After a great deal of negotiation, British and Continental lamp makers had reached some measure of agreement and since the end of 1924 the arrangement had worked fairly satisfactorily. They were not so advanced as regarded valves, but he hoped that a similar agreement would eventually be made in this respect. The British makers would, however, first have to secure a larger share of the business, which was undoubtedly enormous.

Mr. H. Williams proposed the health of the chairman, and Mr. Wilson responded.

Music was provided during dinner by the Hamilton Orchestra, and a concert was given by Messrs. G. Piper, J. Warren, G. Ceci, G. O'Hagan, and Jock Walker and Miss Dorrie Dene.

Henley's Dramatic Club is to be heartily congratulated on the excellence of its presentation of "Nothing but the Truth" (James Montgomery's comedy) at King George's Hall, Caroline Place, W., on Saturday evening last. Mr. H. Stanley as the New York stockbroker, Mr. A. V. Burnett as Bob Bennett, who underwent the ordeal of speaking the absolute truth for twenty-four hours, and Mr. F. J. Bettley as the Rev. Dr. Doran, played important parts in such a manner as to bring credit to themselves and to the Club. Mirth and merriment were well sustained throughout.

The third annual carnival dance of the Cardiff branch of the Magnet Club (the Social Club of the General Electric Co., Ltd.), was held in the Whitehall Rooms, Park Hotel, Cardiff, on Friday, December 19th. A considerable number of the staff with friends and members of other electrical undertakings in the district attended, there being about 130 present. The special lighting and dimming effects were much appreciated.

On Friday last the staff and employés of the Airedale Electrical & Manufacturing Co., Ltd., held their annual whist drive and dance at the Parade Café, Bradford. About 80 persons took part.

Spanish Railway Electrification Contract.—The Sociedad Iberica de Electricidad, of Madrid, the Spanish branch of the A.E.G., is reported to have secured the contract for the electrification of the railway between Bilbao and Las Arenas.

Our Foreign Trade.—NOVEMBER FIGURES.—The Board of Trade returns for November show the following values of electrical imports and exports:—

	Nov., 1925. £	Inc. or dec. £	11 months, 1925. £
Exports.—			
Electrical goods and apparatus	868,865	− 51,985	+1,498,413
Machinery	3,940,718	−335,216	+3,790,577
Electrical machinery	395,344	− 95,017	+ 420,305
Imports.—			
Electrical goods and apparatus	425,648	+ 40,000	930,029
Machinery	891,910	+ 91,768	+1,231,816
Electrical machinery	78,600	+ 6,904	+ 45,788
Re-exports.—			
Electrical goods and apparatus	13,568	+ 3,509	+ 61,093
Machinery	119,811	+ 11,797	+ 250,689
Electrical machinery	7,762	− 680	− 22,759

Accrington Votes for British Cable.—At Accrington Town Council meeting last week there was another long discussion as to whether British or foreign tenders for electric cables should be accepted. The Electricity Committee recommended a contract with Messrs. W. T. Glover & Co., who were willing to offer favourable terms for two years subject to wages and lead and copper prices. Alderman Higham (chairman) said the Committee was satisfied that the Continental product was not equal in quality to the British. They would probably be paying 12½ per cent. more in price, but they would get a better article. Mr. Watson (vice-chairman) said the Committee passed the recommendation by eight votes to three, and they were assured by experts that the British cable was superior. The exact figures were:—1,000 yards of foreign cable, £504; Glover's cable, £596 12s. 6d. If they sent the order abroad they would do an injustice to the British working man, who received a higher wage than the Belgian workmen. Mr. Aspden called attention to the British firm's profits, and asked how it could appeal to the public to buy its cables in face of those facts. If electrical undertakings were firm for three or six months he thought British prices would come down. Mr. Constantine moved the minute back, and said he was not convinced that the foreign cable was inferior. If they passed the minute they would be doing an injustice to ratepayers. If the order went elsewhere it would only add to the shareholders' profits. Mr. A. Wilkinson seconded, and said it was the duty of the Council to accept the lowest tender. Eventually the Committee's recommendation was carried, there being only seven votes for the amendment.

Hydro-Electric Development in Malaya.—The Kuala Lumpur correspondent of the *Financial Times* reports that on December 12th Sir Montague Barlow, on behalf of Sir W. G. Armstrong Whitworth & Co., Ltd., signed the Perak hydro-electric agreement in the presence of the British Resident and the Sultan of Perak. The agreement has been under discussion for several months past following upon a scheme for developing the hydro-electric possibilities of the Perak River submitted by Mr. F. Bolton, who spent over a year prospecting the river on behalf of Sir W. G. Armstrong, Whitworth & Co. Mr. Bolton estimated that a capital of about £2,750,000 would be required to enable the power generated to be sold at a cheap rate. The power will be applied principally in the development of the Kinta Valley and neighbouring tinfields situated in the same State. The company has secured a guarantee under the Trade Facilities Acts to the extent of £1,250,000.

Lighting and Power Notes.

Beckenham.—LOAN.—The Urban District Council has applied to the Electricity Commissioners for sanction to a loan of £10,000 to meet excess expenditure of about £6,000, and to provide for further extensions.

Bristol.—LOAN.—The Electricity Committee has decided to apply for sanction to a loan of £140,000 for mains extensions.

Burnley.—ELECTRICITY SUPPLY.—The Town Council, on December 2nd, decided that it could not agree with the opinion expressed by the Mid-Lancs. Electricity District Board and the Electricity Commissioners to the effect that it should take a bulk supply of electricity from the Lancashire Electric Power Co. rather than proceed with its application for sanction to extend its present station, and decided that the Commissioners should be informed that the Corporation was not prepared to take a bulk supply or to withdraw its application, and that all necessary steps should be taken to extend the Burnley station.

Bury.—ELECTRICITY EXTENSIONS.—The Town Council is applying for sanction to the borrowing of £16,000 for the erection of cooling towers at the Chamber Hall station, £25,000 for mains, and £5,000 for a sub-station.

Canada. — HYDRO-ELECTRIC DEVELOPMENT. — The Toronto correspondent of *The Times* reports that a company headed by Sir Herbert Holt has acquired the right to develop one million h.p. on the St. Lawrence River near the Ontario boundary. In the case of a deficiency in Ontario Sir Herbert Holt is willing to sell 300,000 h.p. to the Ontario Hydro-Electric Commission. It is expected that the Holt development scheme will be completed in the next two years.

Cheltenham.—NEW PLANT.—The Electricity Committee is to install a new boiler, &c., at the generating station at a cost of £11,450.

Continental.—RUSSIA.—In connection with the question of protecting the city of Leningrad against sea floods, a special inter-departmental Commission was appointed some time ago to study the different proposals. The Commission has examined three different schemes, one of them planning high sea dams in the entrance from the Gulf of Finland into the Neva near the Isle of Kotlin, the second suggesting dams in the middle section of the Bay, and the third, erecting dams further up the Neva along the shore line of the Bay, and the seaside line of the isles in the estuary. The second and third schemes embody a proposal to erect a dam on the rapids of the Neva, 18 miles up from Leningrad. This dam would be utilised in connection with a hydro-electric plant working at a head of about 13 feet and yielding approximately 60,000 h.p.

The Schatur State power station, which is situated 130 versts from Moscow, was formally opened on December 6th by M. Trotsky. The station, which has a capacity of 65,000 h.p., burns turf fuel, and will supply power for part of the industrial undertakings in Moscow and the surrounding district.—*Reuter* (Moscow).

AUSTRIA. — Work has recently commenced on the establishment of a hyro-electric plant for the supply of electricity to the town of Trieste. For this purpose a dam is to be constructed on the River Reka; the water will be conveyed by a canal 11¼ miles in length to a large storage reservoir which will give a head to the power station near Trieste or nearly 1,000 ft. It is estimated that 75,000 h.p. is available and that the station will be able to produce 180 million kWh per year.

GREECE.—According to the daily Press, the negotiations conducted in Paris by M. Diomedes, the Governor of the National Bank of Greece, with English, French, and Austrian bondholders concerned in the enterprise for an electricity supply for Athens, were concluded recently. An English power and traction company is principally concerned.

Coventry.—PROPOSED NEW POWER STATION.—The City electrical engineer has submitted a report to the Electricity Committee pointing out that the bulk supply from the Leicestershire & Warwickshire Electric Power Co., will only be sufficient to meet a part of the anticipated increased demands for an electricity supply. The Committee has recommended to the City Council that the Electricity Commissioners be asked for authority to proceed with the erection of the new power station at Longford, in accordance with the understanding arrived at with the Commissioners in the early part of the year.

Dumfries. — HYDRO-ELECTRIC SCHEME. — The Corporation Electricity Committee has under consideration a report prepared by the electrical engineer upon a proposed hydro-electric scheme.

Edinburgh.—ELECTRICAL PROGRESS.—Mr. Seddon, Corporation electrical engineer and manager, in a report to the Electricity Committee, refers to a chart submitted in May showing that the anticipated load for this winter would be 37,700 kW. Up to date the maximum load has already reached 39,400 kW, an excess of 1,700 kW. At the present time the Corporation is installing a 10,000-kW turbo-alternator, which, it is hoped, will be ready in the beginning of the year. To meet future

requirements up to 1938, an additional 25,000-kW turbo-alternator will be needed in 1928 and another in 1930. The Committee has decided that foundations shall be laid suitable for the extension of the station.

Epping.—ELECTRICITY SUPPLY.—The Rural District Council has given its consent to the application of the North Metropolitan Electric Power Supply Co., for a Special Order to supply electricity to parishes in the rural area. The company does not propose to use overhead lines.

Glasgow.—ELECTRICITY SUPPLY.—A report of the meeting between representatives of Messrs. Heenan & Froude, Ltd., and the Corporation Cleansing and Electricity Departments with regard to the power station to be installed at the Corporation's new refuse disposal works has been submitted by the electrical engineer to a sub-committee, which has recommended that the report be approved, and that the Electricity Department be authorised to purchase two 50-cycle feeder panels, as and when required, and that the question of an additional frequency changer be deferred until more definite information is obtained as to the Government's intentions relative to the adoption of a standard frequency.

Godalming.—PRICE REDUCTION.—The Urban Electric Supply Co. has decided to reduce the charge for electricity from 1s. to 10d. per kWh as from January 8th next.

Hastings.—LOANS SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £6,850 for mains, and £30,925 for mains and plant in connection with the bulk supply of electricity to Bexhill Corporation.

Hove.—ELECTRICITY EXTENSIONS.—The Electricity Committee has recommended to the Town Council that further feeder mains be laid from the Davigdor Road works and the Hove Street sub-station at an estimated cost of £11,880.

Kendal.—ELECTRICITY CHARGES.—The Town Council has offered to supply electricity for power to the Barrow Ice and Cold Storage Co., Ltd., at 3d. per kWh up to 30,000 kWh per annum, and at 2½d. per kWh beyond. This scale is to apply to all power consumers in the borough.

Lincoln.—LOANS.—The Town Council has applied for sanction to the following loans:—Cables, £10,000; sub-station and equipment, £2,500.

Liverpool. — LOAN SANCTIONED. — The Corporation has received sanction to the borrowing of £136,674 for the provision of mains, transformers, and switchgear.

London.—BERMONDSEY.—At the last meeting of the Borough Council, the Electricity and Street Lighting Committee reported that it had considered the question of holding an inquiry into the electricity undertaking and recommended that Mr. W. C. P. Tapper, chief engineer to the Stepney Borough Council electricity department, be appointed to conduct the inquiry, and to report to the Council, the terms of reference to be as follows:—To investigate the financial position, technical equipment, and general administration of the electricity department, and to make recommendations as to whether any reorganisation of the department is necessary with a view to securing economies in working, and to effect a reduction in the price of current for light and power. Whether it is desirable to purchase all current in bulk from an outside source or whether it is more advantageous for the Council to continue to generate current itself. Whether the equipment of the station is efficient and economic, or whether all or any part should be replaced by more up-to-date machinery. Generally to make any recommendations necessary for the improvement of the undertaking, having regard to the new position existing in London by the creation of the Joint Electricity Authority. The recommendations of the Committee were agreed to by the Council.

Newcastle-upon-Tyne.—ELECTRICITY AGREEMENT.—The Electricity Committee has prepared an agreement between the Corporation and the Newcastle-upon-Tyne Electric Supply Co., Ltd., for the supply by the Company to the Corporation of such electrical energy as the Corporation may require at the rate of 0.55d. per kWh, subject to increase according to the rise in cost of coal. The Corporation to take a minimum quantity of 250,000 kWh. The company is to provide at its own cost the cable between the company's system and the Manors power station, together with switch panel. The agreement is to remain in force for a period of ten years from May 30th, 1925, and is determinable thereafter on six months' notice by either party.

New Zealand.—LAKE COLERIDGE.—The report of the Lake Coleridge hydro-electric undertaking for the year ended March 31st last shows a total income of £92,163, and working expenditure of £23,270, leaving a gross profit of £68,893. After meeting capital charges, &c., there was a net profit of £5,434. The electrical energy sold amounted to 51,287,033 kWh, as compared with 43,792,472 kWh in the preceding year, and the maximum supply demanded increased from 10,800 to 13,180 kW. Extensions to the generating plant are being made, and it is anticipated that additional plant with a capacity of 15,000 kW will be available by June, 1926. The area of supply is also being extended by the duplication of the present transmission line to Timaru, and the erection of a line to Oamaru.

WAIKATO (HORAHORA).—The accounts of the Horahora undertaking for the year ended March 31st last show a total revenue of £65,184, from which were deducted working expenses (£14,106), interest (£20,129), and depreciation (£9,757), leaving a net surplus of £21,192. The sales of electrical energy amounted to 41,281,159 kWh, an increase of 1,366,305 kWh, as compared with the preceding year, and the maximum supply demanded rose from 7,400 to 8,300 kW. The total system now supplied from Horahora, includes 1,396 miles of transmission lines varying from 50,000 V to 400 V. The Waikato system is being extended, and a 110,000-V line has been completed from Hamilton to Auckland. Other transmission lines of 110,000 V and 50,000 V are in course of erection.

Northern Ireland.—ARMAGH.—The Urban District Council has adopted a memorial to the Electricity Commissioners of Northern Ireland asking for sanction to the erection of a generating plant for the supply of electricity in the district.

NEWRY (CO. DOWN).—The Urban District Council has adopted a revised report submitted by Mr. P. A. Spalding of Dundalk, for the proposed electricity scheme for the town, the capital outlay upon which is estimated at £17,500.

Portsmouth.—LOANS.—The Electricity Committee has obtained sanction to the borrowing of £22,000 for mains, substations and equipment for the added area.

The Corporation is to apply for sanction to a loan of £750,000 for electricity extensions, &c.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

SLOUGH AND DATCHET.—*Slough and Datchet Electric Supply Co., Ltd.*—Lighting: 8½d. per kWh.

WINDSOR.—*The Windsor Electrical Installation Co., Ltd.*—Lighting: From 9½d. to 9d. per kWh. Heating: From 5½d. to 3d. per kWh. Power: A new rate of £5 per h.p. per annum, plus 1d. per kWh, or alternatively the lighting rate.

Ringwood.—INQUIRY.—An inquiry was held recently by Sir William F. Marwood into the application of the Ringwood Electric Supply Co., for permission to erect overhead cables and service connections in parts of the town. It was stated on behalf of the company that unless the use of overhead mains was permitted a supply of electricity could not be provided for the district in question. There was opposition on the ground of unsightliness, the narrowness of the roads, and the depreciation of property.

Sicily.—ELECTRICITY SCHEME.—A scheme is at present under consideration to supply electricity on the island of Sicily from the hydro-electric station in Calabria, the southernmost province of Italy. Three plans for conveying electricity at a pressure of 130,000 V across the Straits of Messina have been prepared. The first provides for an overhead line, supported at each end on steel towers 993 ft. high. It is estimated that there would be a sag of 770 ft. from the horizontal in the centre of the line. The second scheme provides for the construction of two 656 ft. shafts and a tunnel about 2¼ miles in length below the Straits at a depth of 378 ft. below sea level. The third scheme is that of the Pirelli Co., of Milan, which proposes a new type of submarine cable which, although laid on the bed of the sea, would, it is claimed, be capable of successfully transmitting the necessary electrical energy.

Tonbridge.—NEW ELECTRICITY CHARGE.—The Urban District Council has decided to supply electricity for ordinary power purposes at a flat rate of 2d. per kWh as from January 1st next, and to abolish the maximum demand rate.

Walsall.—ELECTRICITY EXTENSIONS.—The scheme for linking up the electricity undertakings in the West Midlands was the subject of a further report at a recent meeting of the Corporation Electric Supply Committee. From this, it would appear that the main transmission lines between Ocker Hill and West Bromwich, West Bromwich and Walsall, and Walsall and Wolverhampton, will be laid forthwith, the extension of the Walsall generating station being regarded as another immediate step necessary. This extension (10,000 kW) is estimated to cost £175,000, and the linking up £200,000.

Worcester.—ELECTRICITY EXTENSION APPROVED.—At a recent meeting of the City Council a recommendation by the Electricity Committee to spend £47,000 upon extensions of plant at the electricity works was approved.

Tramway and Railway Notes.

Bradford.—ACCIDENT.—In the fog, on December 7th, a Corporation tramcar, proceeding from the depôt to the Idle terminus, got out of hand and crashed into the Alexandra Hotel, Idle, the driver and conductor being killed and the car completely wrecked. It is thought that a skid occurred on frosty rails when the brakes were applied.

Burnley.—TRAMWAY EXTENSION.—The Tramways Committee proposes to extend the tramway past the football ground in Brunshaw Road to Stroyan Street, and has recommended that estimates be prepared.

Continental.—BELGIUM.—Good progress is being made with the electrification of the local railways between Antwerp and Santhoven and Antwerp and Schilde. All the standards have been erected, and the cables are now being fixed in position.

ITALY.—A new company has lately been formed at Stradella with a capital of 1,000,000 lire and the title La Società Tramvia-Elettrica Stradella-S. Maria della Versa, to construct an electric tramway between the two towns named.

The Italian State Railway authorities have voted a sum of 60 million lire for the electrification of the railway between Bolzano and Brennero.

(*Continued on page 983*)

A Modern Electric Motor Manufactory.

The Works of Messrs. Electromotors, Ltd., at Openshaw.

IN view of the fact, which all users will readily admit, that the construction and workmanship of electric motors do differ, which dissimilarity however may not always be assessed at its due value, it may be questioned whether the average purchaser exercises sufficient discrimination when buying an electric motor. Such a doubt adds interest to the progress that has been achieved by a manufacturing concern of which high-class construction has been the main object throughout its existence.

Fig. 1.—Shell-boring Machine Shop.

The organisation has been built up from its earliest stages by the present managing director, Sir Benjamin Longbottom, assisted by a trained staff of designers and specialists in the manufacture of electric motors and their application to industry. Launching out in 1900 with new works at Openshaw, Manchester, specially built for the purpose, the company set itself the task of producing a range of direct-current motors up to 25 h.p. of a class not hitherto attempted.* From that period onwards extension has followed extension—in 1908, 1912, 1919, 1921, 1924—and the range of sizes manufactured has been enlarged until today the works are amongst the finest plants in Great Britain for the manufacture of electrical machinery up to units of 250 h.p. in size.

Something more than pure design was required to achieve the results aimed at, and methods had to be employed which do not apply in the general engineering industry, or to those works wherein large varieties of machines are made. Some 24 sizes of d.c. machines and a similar number of a.c. machines represent the whole product of the works, and so it is evident that precision demands a perfect system of jigging, not merely designed for quantity production, but essentially for accurate production, which by their nature inherently enable production costs to be kept down. The provision of suitable jigs and gauges for every machining operation is under the direct control of the tool room, whose duty it is to keep them constantly checked for accuracy against standards. Some of the jigs are of a most elaborate nature; for instance, for every carcase size there is a jig which takes the whole carcase, and every hole in the carcase is drilled at one setting through steel-bushed holes; but even this is not final, as every piece of machinery goes through a separate examining department.

Fig. 2.—Mechanically Finished Motor Body Stock.

The accompanying illustrations give a very clear indication of the organisation, and represent generally a tour through the works, leaving out those subsidiary departments which act merely as feeders to the main productive sections. In explanation, it should be mentioned that, broadly speaking, the mechanical features of the field frames and bearings are always constant, so that it is thus possible to produce each of these standard frames in quantity to a finished mechanical stock, instead of to individual orders, and the lay-out of the works is arranged on this basis. It is this very factor, coupled with the excellent system of jigging, which enables "precision-made" machines to be produced on a competitive basis.

The first of the accompanying illustrations shows a section of the machine shop with the shell-boring machines in the foreground, while the third shows a further section of the shop with the range of boring machines at work on bearing covers, and the second shows the mechanically finished stock of motor bodies, both d.c. and a.c. This is the normal condition of this section of the works, which is

Fig. 3.—Boring Machines at Work on Bearing Covers.

*See ELEC. REV., September 25th, 1908; p. 499.

E

being constantly fed by the machine shops and withdrawn from by the erecting department.

The general stores are worked on a maximum and minimum stock basis to facilitate that prompt service and delivery to customers which is so essential; fig. 4 illustrates a section devoted to the forming of armature, stator and rotor coils, and the insulating and taping thereof, while fig. 5 is a view of the general winding department. The shops illustrated above are all productive departments, and fig. 6 shows where the component parts come together for assembly prior to passing through to the three testing departments, two of which are shown in figs. 8 and 9, being the d.c. and a.c. sections respectively; the final stage of painting and packing is shown in fig. 7.

Fig. 4.—Coil-forming Department.

This description would not be complete without fuller reference to the products manufactured, which cover sizes from 1 up to about 250 h.p.

Some two years ago the machines were entirely re-designed; the type is universal in character and, by the addition or exchange of standard parts, can be adapted to meet widely differing requirements. Both the direct- and alternating-current motors are therefore available in the usual standard types, *i.e.*, enclosed ventilated, cowl or pipe ventilated, watertight, &c., for horizontal running and with vertical spindles for deep-well pumps, ships' bilge pumps, &c.

In a.c. motors, in addition to the ordinary standard squirrel-cage and wound-rotor types of machine, the firm also manufactures a high-torque squirrel-cage motor, having an efficiency and power factor comparable with those of an ordinary squirrel-cage motor, a type which is so largely filling the field hitherto held by the wound-rotor machine. Another speciality is the "Lo-thermo" motor, both d.c. and a.c., manufactured under the licence of Lo-thermo Patents, Ltd., which represents a practical solution of the difficulty of disposing of the conversion losses, which, in a watertight motor, of whatever form, have to be dissipated by radiation through the frame of the machine. The design incorporates the provision of additional radiating surface in the interior air-circulating circuit, and thus utilises material to the best advantage and maintains a highly efficient totally-enclosed motor. Other manufactures include wound-rotor machines with a flameproof slip-ring enclosure for use in fiery mines, and auto-synchronous and synchronous motors, within the limits indicated above.

To indicate the thoroughness of both design and construction, let us examine the standard three-phase squirrel-cage motor: The stators, which have semi-closed slots, are ground by a special machine to ensure the bore being central with the bearing seating to an accuracy of 0.5 of a mil; the rotors, which are built up on spiders, except the smallest sizes, are also ground to the same degree of accuracy, and it is therefore obvious that with the use of ball and roller bearings there can be no danger of the rotor not running central. Reliance is not placed on the simple forcing of the ball or roller race on to a ground shaft, but the latter is specially treated to provide for the reception of this race, and in every case a nut with a locking arrangement is provided as an

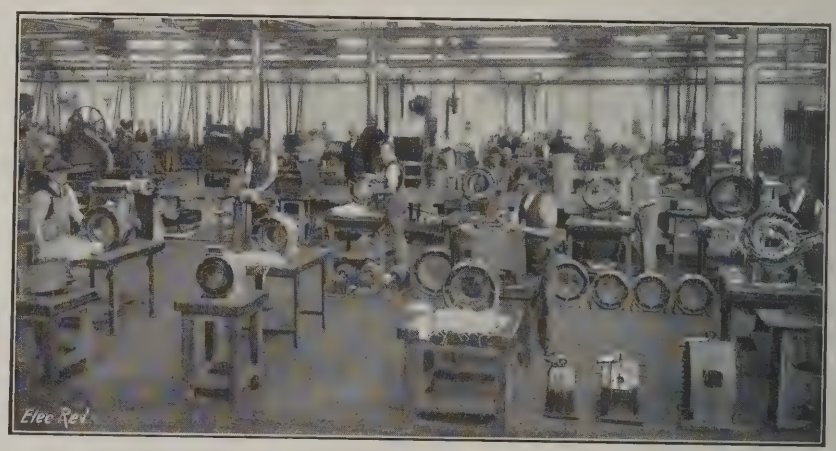

Fig. 5.—General Winding Shop.

Fig. 6.—Assembly of Component Parts.

Fig. 7.—Painting and Packing Section.

additional security. The slots are skewed and the rotor bars are brazed to the end rings. Impregnation of the windings is carried out to the extent of putting the whole stator into the impregnating tanks, and no machine is passed on to a customer until it has been thoroughly tested.

Fig. 8.—Direct-current Testing Department.

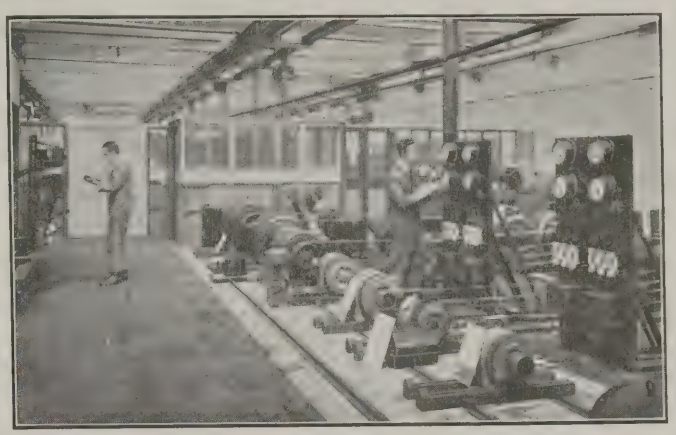

Fig. 9.—Alternating-current Testing Bay.

To a user all these features offer a safeguard of value, much more so to the user overseas, whilst as the whole energies of the Company are concentrated on this range of manufactures, it is able to give a very real and definite service in dealing with purchasers' requirements, especially with regard to prompt deliveries; and concentration on the production of high-class machines has resulted in the firm enjoying the confidence of the home and many oversea Government departments, the home, Indian State, and other oversea railways, the leading shipping lines, most of the home municipalities, and industry generally.

New Automatic Telephone Exchanges.

Leeds Satellite Exchanges, and Strowger Equipment in South Devon.

So far the largest provincial city in Great Britain to be favoured with automatic telephone service is Leeds. The original Strowger equipment was installed under considerable handicap during the war, and was made available for public service in May, 1918, at which date the total number of subscribers was 6,800, but extensions since added bring the present total to 9,600 lines.

Hitherto the outlying suburban exchanges in the Leeds area have been manually operated, but the disparity has now been remedied, for four such exchanges have been equipped with Strowger automatic switching apparatus to operate in conjunction with that at the main Leeds exchange.

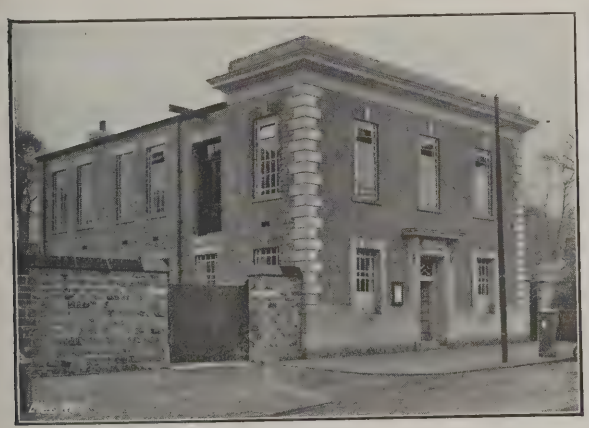

Fig. 1.—Headingley Automatic Telephone Exchange.

Fig. 2.—Chapeltown Strowger Telephone Exchange.

Four Satellite Exchanges at Leeds.

The capacities of the four new above-mentioned exchanges are shown in Table I; in addition, a 200-line extension is in hand at Stanningley, which will ultimately give this exchange a full capacity of 1,000 lines. The equipment at all four exchanges is similar, with the exception of variations in the number of Strowger units and associated selector switches, according to the relative capacities; like that at the Leeds main exchange, the system is five-digit, which involves the use of switching selector repeaters at the satellite exchanges, which perform several functions according to the nature of the call, whether local or distant. Groups of numbers have been allotted to the different exchanges, and automatic subscribers have access to all other automatic subscribers in the Leeds multi-office area by dialling in the requisite group.

In each case the equipment is housed in a new building, fig. 1, located as near as practicable to the economic "telephone centre" of the district it serves. The switchrooms accommodate standard 100-line Strowger line-switch units, fig. 3, and on one side of each unit the rotary line switches are mounted on "gates," fig. 5, each with a capacity for 50 switches, which can be swung outwards for inspection or adjustment. On the other side are fitted the final selectors.

Table I.

	Regular subscribers' lines.	P.b.x. lines.	Total lines.	Ultimate capacity.
Headingley ...	1,400	100	1,500	2,400
Chapeltown ...	1,200	100	1,300	2,100
Roundhay ...	1,100	100	1,200	2,000
Stanningley ...	600	200	800	1,000

Composite trunk boards carry the switching selector repeaters, "O" level repeaters, distributor switches, two-party line equipment, and coin-box repeaters. The selector trunk boards proper have capacities for 240

switches, or 20 per shelf. Outgoing secondary line switches are employed to select and seize a disengaged trunk for distant calls; at the main exchange these trunk connections terminate in first group selectors. The outgoing secondary line switches are located at the satellite exchanges, each rack of five shelves accommodating 25 switches.

The main batteries are in duplicate, and the charging

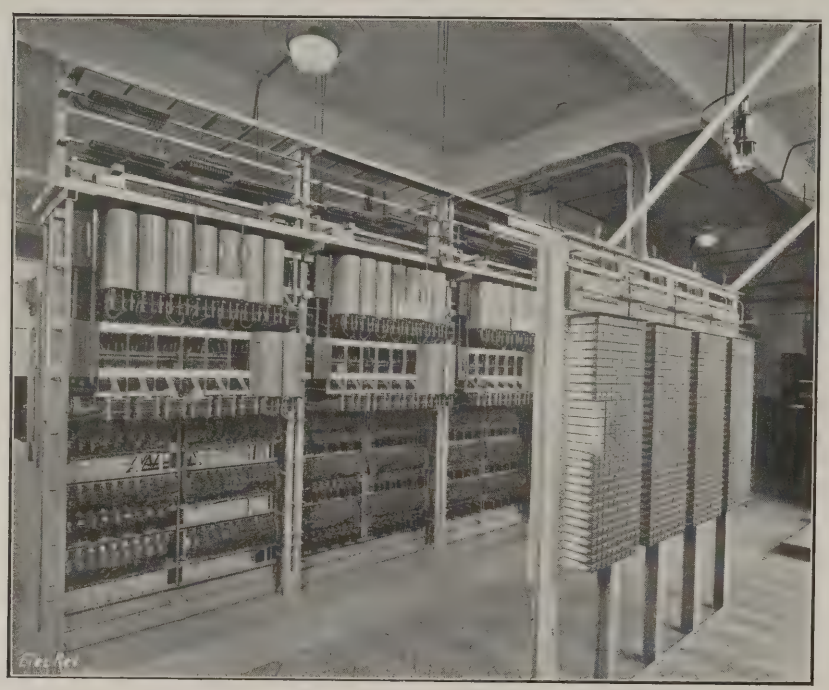

Fig. 3.—Roundhay Exchange; Back view of Line-switch Units, Meter Rack in Foreground.

motor-generators run off the a.c. supply mains. The two ringing rotary converters at each exchange work off the main battery, and also supply the various "tones" required.

Although the conversion of these four Leeds satellite exchanges eliminates manual telephonists for all local calls in the Leeds multi-office area, their services will still be required in connection with all trunk calls as well as for traffic incoming from unconverted exchanges outside the area. Automatic supervisory and fault-signalling equipment is a feature of the satellite and main exchanges, and suburban Leeds will now reap the maximum benefit from the change.

The Torquay Exchange.

Two delightful South Devon resorts will henceforth enjoy the advantages of automatic telephone service,

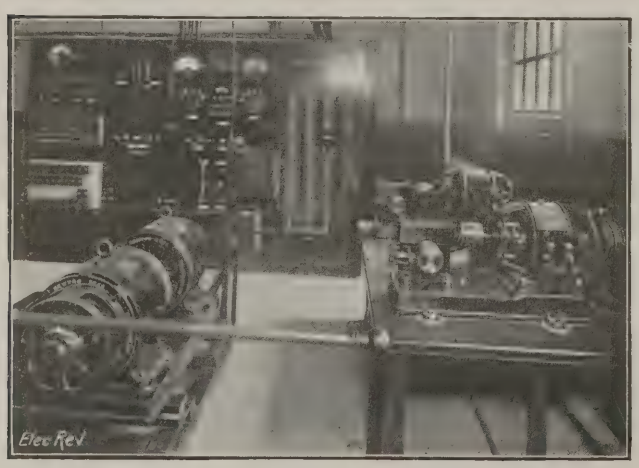

Fig. 4.—Torquay Exchange Power Plant.

both installations having been cut into service on October 31st. Torquay is a seaport and health resort with a population of over 40,000. Paignton lies only two miles south of Torquay, and has a population of over 15,000. Both installations are completed in so far as immediate requirements are concerned, although there is an extension of some 200 additional lines in hand for Torquay, which is to be ready for service early next year. The Torquay exchange is located at the Post Office, and comprises 19 Strowger units equipped with rotary line switches and final selectors. Of the 1,800 lines initially provided for, 1,600 are regular subscribers' lines, and 200 are p.b.x. lines; provision is also made for 40 coin-box lines. The system is 4-digit, so that all Torquay subscribers dial four-figure numbers for local calls, the numbers for Torquay being in the 2 and 3 thousand group. The present equipment is arranged to accommodate St. Marychurch subscribers, whose numbers lie in the 7 thousand group. Access to Brixham, a satellite to the Paignton exchange not yet converted to automatic operation, is obtained by dialling "57" when the Brixham operators complete the call.

The power board at the Torquay exchange, fig. 4, comprises four panels: On the left-hand panel is mounted the supervisory equipment, and the fourth panel is associated with the manual equipment. The main batteries are in duplicate, comprising two sets of 25-BPW, 9-element Chloride cells in lead-lined wood boxes, and the present capacity of each battery is 602 ampere-hours. The charging motor-generator, by Newton Bros., has an output of 110 amperes at 57 volts and a speed of 1,000 r.p.m. One of the ringing dynamotors (fig. 4, right) is designed for direct connection to the supply mains, and the other for working off the main battery in series with an impedance coil. The supervisory alarms are divided in order of urgency; the non-urgent alarms indicate transient or non-persistent faults, and the main alarm indicates the exact nature of a fault and its location.

The Paignton Exchange.

The automatic exchange serving Paignton comprises eight Strowger 100-line units, accommodating a total of 700 lines, 600 of which are regular subscribers' lines and 100 p.b.x. lines. Of these units one is specially equipped with 20 rotary line switches for coin-box service. The system is also four-digit, with numbers

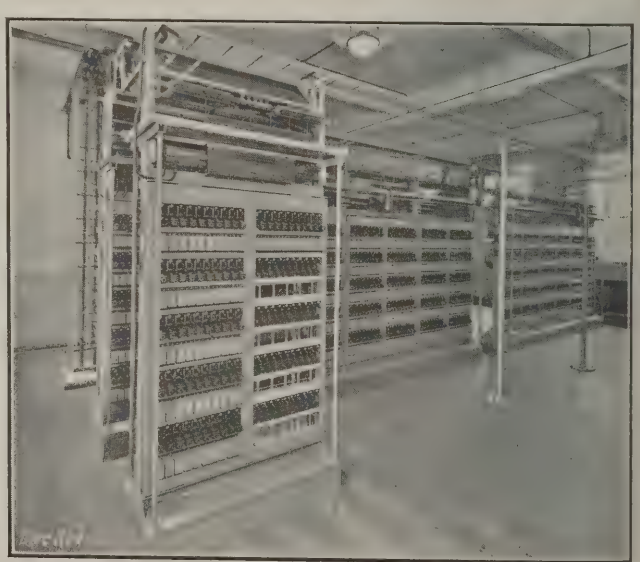

Fig. 5.—Stanningley Exchange; Rotary Line Switch Units.

in the 5 thousand group. Paignton subscribers dial direct to Torquay and St. Marychurch subscribers, and have access to the operators at Brixham.

The entire equipment of the above-mentioned exchanges was manufactured and installed for the Post Office Telephone Department by the Automatic Telephone Manufacturing Co., Ltd.

Tramway and Railway Notes.

(*Continued from page 978.*)

Irish Free State.—THE LUCAN (DUBLIN) ELECTRIC RAILWAY.—It is announced that the Dublin United (Electric) Tramway Co. is willing to purchase and work the Lucan-Dublin Electric Railway services which have been suspended in recent months, provided the Dublin City Commissioners and the townships agree to postpone for 42 years the right to purchase the tramway within their respective areas. The Dublin Commissioners and the Blackrock Urban District Council have given consent, and the consent of the other townships concerned is anticipated.

Kidderminster.—TRAMWAY IMPROVEMENTS.—The Kidderminster and Stourport Tramways Co. is contemplating the doubling of its tramway track and carrying out extensions in Vale Road.

London.—PROPOSED NEW TUBE.—According to *The Times*, the Metropolitan Railway Co. is seeking Parliamentary powers to construct a relief line which, it is expected, will materially facilitate the manipulation of traffic in North-West London. It is proposed that the new line will run parallel, on a falling gradient, with the existing Metropolitan line from a point immediately south of Willesden Green Station as far as Mapesbury Road, which is a short distance north of Kilburn and Brondesbury Station, making a triplicate "up" and "down" line over this portion of the railway. The proposed line will then change direction and run under the company's fast and local lines, entering two deep-level tunnels which will take the line under High Road, Kilburn, Maida Vale, and Edgware Road, and join with the Metropolitan "Inner Circle" lines by means of a 200-yards "cut and cover" section a few yards west of Edgware Road Station. The line will run through the administrative areas of the urban district of Willesden, the boroughs of Hampstead, Paddington, and Marylebone, and will have three stations conveniently placed along the route.

UNDERGROUND STATION RECONSTRUCTION.—The Underground Company has placed a contract with Messrs. James Carmichael, Ltd., for the entire reconstruction of the City line stations at Clapham Road and Oval. The schemes include the removal of the lifts and the installation of escalators, and it is expected that the new stations will be completed in about May of next year.

Perth.—TRAMWAY IMPROVEMENTS.—The Corporation Tramway Committee has adopted a recommendation that the whole of the tramway track be electrically welded.

Sheffield.—NEW DEPOT.—The Corporation is to spend £85,000 on the erection of a new tramway shed and garage at Trenter Street. Fifty new tramcars and 15 new motor-'buses are on order.

Telegraph and Telephone Notes.

China.—TELEGRAPH CHAOS.—As a result of the struggle between the rival war-lords in China, says the *Daily Mail*, the Great Northern Telegraph Co. gave notice on December 11th of indefinite delay to cablegrams intended for Peking, the capital, "owing to the total interruption of Chinese land-lines."

France.—TELEGRAPH RATES.—As from December 10th, French telegraph and telephone rates for international communication have been multiplied by five, as compared with 4.9 at the beginning of the month. The figure has been steadily rising for some time; at the beginning of August it stood at four.—*Reuter* (Paris).

Irish Free State.—AUTOMATIC TELEPHONY.—Some months ago Mr. J. J. Walsh announced that Dublin would within a few years be completely equipped with automatic telephones. The first automatic telephone exchange is to be opened in Ship Street next year, but it is understood that the change cannot be completed before 1932.

Rugby Radio Station.—TESTS.—The Government's radio-telegraph and telephone station at Rugby, one of the largest in the world, has been completed and will, *The Times* expects, be working on January 1st. Experimental transmission has been carried out for some time, and Morse messages on a wave-length of 17,500 metres have been heard clearly in Australia, also in America and South Africa.

Jugo-Slavia.—STOCKHOLM POSTAL CONVENTION.—Parliament ratified the Universal Postal and Telegraph Convention of Stockholm on December 11th.—*Reuter* (Belgrade).

The Telephone Service.—OPERATORS.—Post Office statistics show that of the 9,325 applicants for positions as telephonists last year, only 1,551 girls were able to qualify for service. The chief causes of failure are stated to be: Defective or slovenly speech, undesirable accent, defective hearing or eyesight, and bad spelling.

United States.—"TELEPHONE SKYSCRAPER."—The largest telephone exchange in the world will be opened in New York next March by the New York Telephone Co. It occupies an entire block, one acre in extent, and faces the waterfront. The new exchange is 32 storeys high; the first ten floors cover the full acre and the remainder taper off in accordance with the building regulations. Actually, six exchanges will be housed in the building, and they will control 120,000 telephones. While most of the exchange buildings in the city districts will still be maintained, the business for them all will be managed by 6,000 employés in the new building. The building stands 498 ft. above ground (nearly a third higher than St. Paul's), and there are also five floors extending 72 ft. underground. The total cost will be more than £3,000,000.

Radio Notes.

Daventry.—MISHAPS.—The British Broadcasting Co.'s high-power station (5XX) at Daventry ceased transmitting for a while on Saturday afternoon, December 12th; due to a technical defect it again stopped radiating for a few minutes on Monday evening last.

France.—LICENCES.—The question which has been exercising the minds of the 700,000 French listeners for three years —"Will there be a State monopoly of broadcasting?"—has been settled, the State virtually accepting the trust through its imposition of taxes on wireless receiving sets. The *Daily Mail* explains that the new taxes on receivers are: 60 fr. (about 9s. 6d. at the present exchange rate) for the first year and 50 fr. (8s.) for the succeeding years on all valve sets; and 20 fr. (3s. 2d.) for the first year and 15 fr. (2s. 4d.) for the succeeding years on crystal sets. Listeners must pay 10 times the amount due if they are found to be pirates, and there is also a tax of 2 fr. (about 4d.) on the sale of valve sets, failure to pay involving a liability of from £4 to £8.

Korea.—BROADCASTING STATION.—His Majesty's Consul-General at Seoul (Mr. Arthur Hyde Lay) reports to the Department of Overseas Trade that arrangements have been made for the foundation of a broadcasting station in Seoul. The prospectus issued by the Preparatory Committee states that the projected Broadcasting Bureau will make provision for the whole country daily, in both Japanese and Korean. The monthly charge for a receiver is estimated at 2 yen, and contributors to the capital fund of the Board will be granted a 50 per cent. or more reduction, which is to be increased as the number of subscribers increases. The Corporation maintaining the Bureau will be capitalised at 200,000 yen and the gross receipts of the first year are estimated at 102,000 yen, of which amount 12,000 yen will be net profit. Membership of the Corporation will be of two classes: ordinary membership can be obtained by subscribing for one or more shares of 100 yen each, and special membership by subscribing for five shares or more.

Radiophony Union.—BRUSSELS MEETING.—Delegates from 11 European countries met on December 14th in Brussels, under the auspices of the International Radiophony Union to consider plans for improving the wave-length interference problem. Great Britain was represented by Capt. P. P. Eckersley.

Ships' Radio Operators.—STRIKE.—Mr. J. C. A. Ward, chairman of the Engineering and Allied Employers' (London and District) Association, in a statement to a Press representative, is reported to have said that the number of ships' operators who have sailed under the reduced wages scale since the wages dispute commenced (up to December 14th) was over 300. He pointed out that since 1920 the wages of seagoing operators had fluctuated with the rise and fall in the wages of other seafarers, and in this respect the operators benefited with the other seafarers in the increase given in 1924. The present reduction was less onerous for operators than for the other seafarers, inasmuch as the reduction for the latter commenced as from August 1st, whereas that for the operators commenced on December 1st, or four months later.

Ships' Wave-lengths.—MODIFICATION.—It is reported that the radio-telegraph installations aboard the Southern Railway Co.'s 25 passenger ships, and also those of its Newhaven and Dieppe land stations, are to be converted so as to work on a wave-length of 800 metres, thus avoiding interference with the B.B.C. programmes on the South Coast.

United States.—RADIO CONFERENCE.—There is an "awful warning" of what may happen in Europe in the recommendations of the Fourth Annual Radio Conference in the U.S.A., held a week or two ago in Washington. According to the *Evening News*, drastic steps were called for by a committee, and the 600 members of the conference accepted the proposals with only occasional modifications of details. On the subject of congestion on broadcast wave-lengths, for instance: "The conference was overwhelmingly in favour of granting no more licences until the number of existing stations is materially reduced," and voted for "progressive reduction of the number of broadcasting stations." It also "opposed the granting of additional licences by dividing time with existing stations." Another recommendation is that of the abandonment of spark telegraphy by amateurs, which interferes with the reception of programmes transmitted on ultra-short wave-lengths by some of the big American stations. Most drastic of all is the recommendation for dealing with the "howler." The conference urged that a definite date should be fixed after which the manufacture of "radiating receivers" should be prohibited, and that if manufacturers disregarded this recommendation an attempt should be made to make the manufacture of radiating receivers illegal.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—April 12th, 1926. State Electricity Commission of Victoria. Plant for the Sugarloaf and Rubicon hydro-electric scheme, consisting of turbo-generators, transformers, switchgear, cranes, and accessory plant. (December 11th.)

Victorian State Railways. January 20th, 1926. Automatic battery-charging equipment.* January 13th. Double recording wattmeter.*

Ayrshire.—December 31st. Education Authority. Electrically wiring the extension to Ochiltree school. Specifications from Mr. Wm. Reid, master of works, Education Offices, Ayr.

Beckenham. — January 14th. Electricity department. ater heating and softening plant. (See this issue.)

Belgium.—December 30th. Belgian Ministry of National Defence, 10, Rue du Méridien, Brussels. Wireless telegraph apparatus for use on military aeroplanes. Particulars (Cahier des Charges Special, No. 636) for 4 fr., from 15, Rue des Augustins, Brussels.

December 29th. Portable accumulators for the telegraph section of the Belgian Army. Particulars (Cahier des Charges, No. 655) for 5 fr., from 15, Rue des Augustins, Brussels.

Brentwood.—January 1st. Guardians of Billericay Union. Electrical wiring in conduit and installation of complete electric generating plant at the Institution, Billericay. (December 11th.)

Dublin.—December 29th. Commissioners of Public Works. Installation of electric lighting at the Irish Land Commission Offices, Upper Merrion Street, Dublin. Specification (20s.) from the Secretary, Office of Public Works, Dublin.

Dundee.—January 14th. Electricity Department. Two electrically-driven centrifugal drainage pumps controlled by float gear. (See this issue.)

Edinburgh.—January 4th, 1926. Electricity Supply. Two 1,200-b.h.p., 6,600-V, 3-ph. induction motors. (December 11th.)

Edmonton.—Education Committee. Wiring offices at Brettenham Road, Edmonton, for electric light. (December 11th.)

Egypt.—CAIRO.—February 20th. Director-General, Mechanical Department, P.W.M. Power plant for Giza.—*Reuter's Trade Service* (Cairo).

January 20th. Local Commissions Section. Electric motor and accessories for Manfalout waterworks.*

Glasgow.—December 21st. Corporation. Electric lighting works at Bellefield Sanatorium. Specifications from Office of Public Works, City Chambers. Electric lighting works at Possil and Balornock housing schemes. Specifications, &c., from Mr. R. B. Mitchell, 75, Waterloo Street, Glasgow.

Kilmarnock.—Corporation. Electric lighting of tenement houses. Schedules from Mr. W. Dunbar, burgh surveyor.

London.—LONDON COUNTY COUNCIL.—December 31st. Renewal of the storage battery at Bexley Mental Hospital. (December 11th.)

CAMBERWELL.—January 11th, 1926. Borough Council. Stores, including electric lamps, for 12 months. Particulars from Borough Engineer, Town Hall, Camberwell.

METROPOLITAN ASYLUMS BOARD.—December 30th. Installation of fire-alarm system at Tooting Bec Hospital. (See this issue.)

Manchester.—December 30th. Electricity Committee. One single unit (or, alternatively, one double unit) three-phase induction regulator. (December 11th.)

Two 1,000-kW and seven 750-kW motor converters, or, alternatively, rotary converters and static transformers. (See this issue.)

Marsden (Yorkshire).—December 23rd. Installation of electric lighting at Liberal Club. Mr. G. Holroyd, 28, Peel Street, Marsden, near Huddersfield.

New Zealand.—WELLINGTON.—February 16th. Outdoor switchgear for the Waikato electric power scheme.*

AUCKLAND.—February 8th. Auckland Electric Power Board. Overhead cotton-covered triple-braided cable.*

February 22nd. 15-amp. cut-outs.*

Preston.—January 15th. Electricity Department. Supply and erection of approximately 15 miles of 33,000/45,000-V double transmission lines. (December 11th.)

South Africa.—JOHANNESBURG.—January 28th, 1926. S.A. Railways and Harbours. Eleven 4-ton electrically-driven wharf jib cranes and seven electric capstans for Durban Harbour. Secretary to the Tender Board, S.A.R. Headquarters, Johannesburg.*

UNION TENDER BOARD.—January 28th. Miscellaneous telegraph and telephone materials for the Department of Posts and Telegraphs.*

Uruguay.—February 23rd, 1926. State Electricity Supply Works. Porcelain insulators and accessories.* D.c. and a.c. meters.*

Wakefield.—The Corporation is inviting tenders for the installation of electric lighting at the Corporation baths.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barnsley.—Electricity Committee. Recommended:—
Cables.—Scheduled prices based on electrolytic copper bars at £65 10s. per ton, and English lead at £33 per ton.—British Insulated and Helsby Cables, Ltd.

Carlisle.—Electricity Committee. Accepted:—
Cast-iron piping for condensing-water system (£4,795).—Pratchett Bros.
Large water valves (£1,199).—Blakeborough & Sons.
3-ton crane and gantry (£268).—Herbert Morris, Ltd.

Chesterfield.—Electricity Committee. Accepted:—
2,000 yd. of cable (£410 10s.).—Western Electric Co., Ltd.
1,250 yd. overhead distribution cable (£235).—Macintosh Cable Co., Ltd.

China.—SHANGHAI.—Electricity Department. Accepted:—
Four large air preheaters (total heating surface 192,800 sq. ft.), for the Riverside power station.—Howden-Ljungström Preheaters (Land), Ltd.

Dorchester.—Electricity Committee. Recommended:—
Recording ammeter.—Elliott Bros.

East Ham.—Lighting Committee. Accepted:—
Switchgear (£250).—A. Reyrolle & Co., Ltd.

Glasgow.—Baths Committee. Recommended:—
Installation of electricity at Cowcaddens Workhouse (£265).—Chas. Maguire.

Tramways Committee. Recommended:—
Rheostats for cars.—Traction Equipment Co., Ltd., and Electro-Mechanical Brake Co., Ltd.
Steel track shoes.—Acme Steel and Foundry Co., Ltd., and N. B. Steel Foundry, Ltd.
Brake chains.—Weldless Chains, Ltd.

Gravesend.—Electricity Committee. Recommended:—
Boiler-house extension (£1,800).—Hopkins & Sons.

India.—High Commissioner. Accepted:—
Two contracts for hydraulic plant for the East India Railway locomotive works at Lucknow and Jamalpur.—Hollings & Guest, Ltd.

London.—ST. PANCRAS.—Electricity and Public Lighting Committee. Recommended:—
Steam-recording apparatus for two new boilers (£547).—Industrial Combustion Engineers, Ltd.
Two 1,000-kW motor converters (£8,212).—British Thomson-Houston Co., Ltd.

LONDON COUNTY COUNCIL.—Highways Committee. Reconstruction of switchgear at Shoreditch sub-station:—

A. Reyrolle & Co., Ltd.	£3,989*
Ditto (alternative)	4,113
Bertram Thomas	3,989*
(alternative)	4,113

*Not to specification.

The tender of Metropolitan-Vickers Electrical Co., Ltd., at £4,080, less £441 in respect of a battery-charging set and panel quoted for, has been accepted by the Committee.

PADDINGTON.—Great Western Railway Co.
Gasfilled lamps.—Siemens & English Electric Lamp Co., Ltd.

Portsmouth.—Board of Guardians. Accepted:—
Electrical stores and electric lamps.—H. A. Evans.

Stafford.—Electricity Committee. Accepted:—
Boiler feed pipes.—Aiton & Co., Ltd.

Stourport.—
Wiring the Stourport lighting and power station for electric light.—B. French.

Sunderland.—Corporation. Accepted:—
De-aerating plant.—Hick, Hargreaves & Co.
500 15-amp. meters.—Robert Hornby & Co., Ltd.

Weymouth.—Electricity Committee. Accepted:—
Laying mains (£650).—Johnson & Phillips, Ltd.

Forthcoming Events.

Manchester Electro-Harmonic Society.—Friday, December 18th. At the Albion Hotel, Piccadilly, Manchester. Smoking concert.

Junior Institution of Engineers.—Friday, December 18th. At E.L.M.A. Lighting Service Bureau, 15, Savoy Hill, Strand, W.C. At 7 p.m. Lecture on and demonstration of industrial and domestic electric lighting.

British Electrical Development Association.—Friday, December 18th. At Australia House, Strand. Display of electrical films.

Birmingham Electric Club.—Friday, December 18th. At the Grand Hotel, Colmore Row, Birmingham. At 7 p.m. Annual meeting.

Salford Technical and Engineering Association.—Saturday, December 26th. At the Royal Technical College. At 5.30 p.m. Annual social.

Notes.

The Electrical Engineers' Ball, 1926.—The seventeenth annual Electrical Engineers' Ball will take place at the Hotel Cecil on Friday, February 12th, 1926. The event is one of the outstanding features of the London electrical season, and for the information of those of our readers who are interested we give below, as usual, a full list of the members of the general and executive committees :—

HON. SECRETARIES: A. M. Sillar; W. S. Lonsdale.

HON. TREASURER: J. E. Kingsbury.

"All-Electric" Houses.—An interesting experiment by the City of Birmingham Electric Supply Department, in electric (artisans') houses is to be made, for a week beginning December 14th, on the Woodlands estate, Northfield, Birmingham. One house is "all electric" and a second "electric" apart from one coal fire to heat the kitchen. The electrical equipment actually included in the purchase price (£500 each) of the "all-electric" houses is as follows:—A 3-kW wash-boiler; one 30-gallon hot water storage tank, constant loading 450 watts with boost load of 2,000 watts; one 6-kW Santon hot water geyser for intermittent use in kitchen; one 3-kW fire for drawing room; one 2-kW Utility fire for living room; one 2-kW fire for bedrooms; and the usual lighting points. A 6-kW cooker will be taken on hire from the Corporation Electric Supply Department.

The Liverpool Corporation has decided to erect 250 all-electric houses on the Walton Clubmoor estate. These houses will have electrical appliances for heating, lighting, cooking, washing, and hot water supply. They will be specially designed, and as they will have neither fireplaces nor flues, there will be no chimney pots. The cost of construction will be cheapened, although special means of ventilation will be provided. Our local correspondent was shown the type of electric fire which will be installed, producing the illusion of a live coal fire. All-electric house occupiers will get their electricity supply at the low price of ½d. per kWh. The Corporation has obtained useful data from two all-electric houses which have given satisfactory results, on the Larkhill estate. The all-electric houses are of particular interest in view of the decision announced by the Minister of Health that an inquiry is being made to ascertain which local authorities are encouraging the adoption of devices in their houses to reduce the smoke nuisance. The Liverpool Housing Committee and the City Electric Supply Department are co-operating in the scheme. Pratically every house now erected in the Liverpool area is wired for electricity.

The Electrical Association for Women.—The recently inaugurated Glasgow and District Branch of the Electrical Association for Women commenced its activities on December 11th, by a visit to the Dalmarnock power station of the Glasgow Corporation electricity department. There was a good attendance of members, including Lord and Lady Belhaven and Stenton. After being shown round the power station the company had tea in the "all-electric" canteen. The branch secretary is Miss R. F. Kennedy, Electricity Showroom, 251, S uchiehall Street, Glasgow.

On Tuesday, December 8th, a party of 30 members of the E.A.W. visited the "Tricity" showrooms at the invitation of Mr. A. F. Berry. The party was first conducted round the showrooms, where there was a special display of "Sun Ray" radiators and other domestic apparatus. Tea was taken in the restaurant, after which Mr. Berry gave a talk on "Electricity and Health."

Late Legal.—SOUTHPORT CORPORATION *v.* BIRKDALE DISTRICT ELECTRIC SUPPLY CO., LTD.—Lords Birkenhead, Atkinson, Sumner, Wrenbury and Carson, on December 14th heard arguments in the House of Lords in the appeal of the Birkdale District Electric Supply Co., Ltd., *v.* The Corporation of the Borough of Southport. It was claimed by the Southport Corporation that by virtue of clauses included in indentures dated 1901 and 1904 it was entitled to prevent the appellants from charging higher prices for electrical energy within the district formerly within the jurisdiction of the old Birkdale Urban District Council, than the Corporation was charging within the original Southport area. Mr. Justice Astbury, in the Chancery Division, dismissed the Corporation's action, but the Court of Appeal, reversing his decision, granted an injunction. The company now appealed to the House of Lords, with a view to getting Mr. Justice Astbury's judgment restored. In stating the case for the company, Mr. Clauson said it was an attempt to fetter or abrogate statutory power and was *ultra vires*. whether such fetter was or was not incompatible with carrying out the general purposes of the undertaking, in relation to which the power had been conferred. Lord Birkenhead said that the appellants were asking to be allowed to repudiate part of the agreement while retaining all the advantages for which it was a consideration. Counsel said the terms of the transfer had, under statute, to be approved by the Board of Trade, and from that the conclusion was to be drawn that the only legal consideration was the consideration stated in the deed and approved by the Board. At the conclusion of the arguments for the appellants the Law Lords called upon Mr. Greene to put before them the case for the Corporation, and the learned Counsel was still speaking, when the further hearing was adjourned till December 15th. The Corporation submits that the Legislature has cast upon the appellants no obligation to make particular, or any charges for electrical energy supplied to consumers, and that there is nothing in the Birkdale Lighting Order, or the Electric Lighting Act, 1882, or otherwise in law to prohibit the appellants from entering into any reasonable business agreement to limit the charges to be made by them.

The hearing was continued on December 15th and at the request of Lord Birkenhead, the respondents' leading Counsel, Mr. Greene, proceeded to discuss the judgment of Mr. Justice Russell in the York Corporation case, in relation to power to trustees to make improvements in the navigation in the River Ouse, for which purpose they were authorised to levy tolls up to a certain rate.

The learned Counsel proceeded to indicate the differences which, he suggested, existed in the York case which distinguished it from the present one.

The House reserved judgment.

Inside Frosted Lamp Bulbs.—Lamp bulbs frosted on the inside in such a manner as to diffuse the light by refraction of the direct rays, are a feature of the new standard line of lamps recently introduced by the Westinghouse Lamp Co. The new line will consist of five sizes of lamps, and will replace a number of the forty-five lamp types of 100 watts and under now in common use. The first of the line, a 25-watt lamp, has already been placed on the market. This finish eliminates glare and makes it easy to keep the lamp clean, and so renders it more efficient throughout its life. It is claimed that the initial loss by absorption is less than 2 per cent. of the light output. In appearance the bulb is a neutral grey with a highly polished exterior and has the shape naturally taken by a falling drop of water; a coiled filament is used.

World Power Conference.—SECTIONAL MEETING.—We have received from the Secretary of the World Power Conference (36, Kingsway, London, W.C.2), the technical programme of the sectional meeting which is to be held at Basle from August 31st to September 12th, 1926. Section A deals with the "Utilisation of Water Power, and Inland Navigation"; Section B with the "Exchange of Electrical Energy between Countries"; Section C with the "Economic Relation between Electrical Energy produced Hydraulically and Electrical Energy produced Thermally: Conditions under which the two Systems can work together with Advantage"; Section D with "Electricity in Agriculture"; and Section E with "Railway Electrification."

All papers will be printed in Switzerland under the supervision of the Swiss National Committee of the World Power Conference, and will be available for the participants before the Conference opens. It is intended that the papers, together with the discussions thereon, shall be published after the Conference by the Swiss National Committee in a special volume to be entitled "Transactions of the World Power Conference Sectional Meeting, Basle, 1926." Distinction is made between: Papers contributed by authors in the different countries by request or on the initiative of the respective National Committees or of a member of the International Executive Council, World Power Conference (*National Papers*); and Papers prepared by general reporters appointed by the Swiss National Committee, containing a summary of all the national papers presented before April 1st, 1926, under the respective headings of the Technical Programme (*Reporters' Papers*). National Papers will be accepted for presentation to the Conference only when forwarded by a National Committee or by a member of the International Executive Council. Each country will present only one National Paper under each of the items A to E of the Technical Programme; these National Papers may be prepared by one or several authors. Official delegates to the World Power Conference are entitled to one copy each of papers which are of particular interest to them. Advance copies will be available for sale. All communications regarding the meeting should be addressed to the secretary as above.

Large Hydro-Electric Plant in Italy.—The De Bretto, Escher Wyss Co., of Schio, the Italian branch of the Swiss Escher Wyss Co., has just secured a contract for two vertical-shaft turbines which, it is claimed, will be the largest so far constructed in Europe. They are to develop 50,000 h.p. each under a head of 646 ft., and are intended for the new Galleto hydro-electric station on the River Velino of the Società Industria e Elettrica, of Terni, near Rome.

Bauxite in Montenegro.—According to a report from Cetinje, large deposits of bauxite have been discovered between Bar and Ulcin, and have already been investigated by the Vienna geologist, Herr Korner. The deposits are said to be similar to those in Hungary, and are estimated to represent 30,000,000 tons. The distance to the nearest port in the bay of Mrkovac is 5.5 miles. It is stated that a Splitler firm has provisionally obtained working rights, although negotiations are pending with French and German firms for the opening up of the deposits on a large scale.

Electric Furnaces in France.—Dealing with the progress of electrometallurgy in France, a Paris journal points out that most of the electric furnaces in use in that country for such purposes have a capacity of from 2 to 3 tons, although some of recent types have a capacity up to 15 tons. In 1913 there were 24 furnaces in operation for the manufacture of steel, the production in that year having amounted to 21,124 tons of ingots and castings and 11,700 tons of finished products. The number of furnaces which served for the manufacture of ferro-alloys was much greater and their output amounted to about 30,000 tons. At that time the electrometallurgical industry comprised 12 companies with a share capital of 41,600,000 fr. The annual production for French consumption was about 3,000 tons of ferro-silicon of from 25 to 90 per cent., but calculated at 50 per cent., and that of ferro-tungsten amounted to 250 tons. In the meantime development which has taken place has brought the number of companies up to 22, of which a certain number produce both ferro-alloys and carbide of calcium. Most of these undertakings are situated in the region of the Alps (Isere, Savoie, and the Dauphine), where they are grouped in those districts wherein the use of water power has been the most developed; but they are too distant from seaports for the import of raw materials as well as from the chief centres of consumption. During 1924 the manufacture of ferro-silicon alone absorbed over 100,000,000 kilowatt-hours, corresponding to a production of more than 13,000 tons of this alloy. The production of ferro-manganes in the electric furnace in 1924 ranged from 20,000 to 30,000 tons. Among other products are mentioned ferro-chrome, silico-managanese, and ferro-tungsten. In the case of carbide of calcium it is stated that the production in electric furnaces only reached 31,500 tons in 1913, but increased to over 110,000 tons in 1924. Of this total a quantity of 40,000 tons was used for autogenous soldering, 20,000 tons for fixed and portable lighting, 38,000 tons was converted into cyanamide and 10,000 tons used for chemical purposes.

Electricity in Mines.—Spanish Competition.—The Mines Department of the Spanish Government has recently issued particulars of a competition, open only to Spanish engineers and in respect of which a first prize of 8,000 pesetas is offered together with two second prizes of 2,000 pesetas each, for the best outline of a modern electrical installation for mines, embracing extraction, ventilation, traction below ground, mechanical preparation, &c. The competition will remain open until March 15th next.

High-frequency Rays.—In *Nature* of December 5th, an address delivered by Dr. R. A. Millikan, before the National Academy of Sciences, Madison, U.S.A., on "High-frequency Rays of Cosmic Origin," was reproduced. The author stated that in 1903 the British physicists Rutherford and McLennan noticed that the loss of charge of an electroscope in an air-tight chamber could be reduced by enclosing the whole in a completely encircling metal shield a centimetre thick, showing that the leakage was not due to imperfect insulation but to highly penetrating rays which could pass through the shield and ionise the gas inside the chamber. The rays were at first attributed to radioactive materials, but in 1910 it was found that the radiation did not decrease rapidly with altitude, and German physicists reported in 1912-14 that it greatly increased at a height of 9 km.

After the war Dr. Millikan and Mr. I. S. Bowen sent up balloons containing recording instruments to a height of 15.6 km. (nearly 10 miles) and proved conclusively that the "penetrating radiation" was greater there than at the earth's surface. In 1923 Dr. Russell Otis and Dr. Millikan went to the top of Pike's Peak, and made further experiments; and in the summer of this year Mr. H. Cameron and the author ascended to Muir Lake, 11,800 ft. high, at Mount Whitney, where they sank their electroscopes to various depths down to 60 feet. Their experiments left no doubt that the rays could penetrate the water to a depth of 45 feet, and as the atmosphere above the lake had an absorbing power equivalent to 23 ft. of water, the total penetration was equal to 68 feet of water, or 6 feet of lead. The most penetrating X-rays cannot go through half an inch of lead. High penetrating power means high frequency, and according to a formula valid with longer waves, the wave-length of the shortest waves the experimenters discovered was 0.0004 Angstrom, or one-fiftieth of that of the hardest gamma rays previously known; the longest was 0.00067 Angstrom. Their conclusions were accurately verified at another lake. The author suggested that the rays were due to nuclear transformations of some sort, enormously more energetic than those taking place in any known radioactive changes. They come to the earth with equal intensity from all directions by day and night.

Discussing these observations in a letter to *Nature* of December 12th, Dr. J. H. Jeans suggested that the radiation was generated by quanta of wave-length 1.3×10^{-13} cm., each quantum being produced by the simultaneous destruction of one electron and one proton. Such newly generated energy could escape from the transparent nebulæ into space, and its penetration into our atmosphere would seem to provide a natural explanation for the radiation investigated by Millikan. The high-frequency radiation from the great nebula in Andromeda alone would contain sufficient energy to produce about one-half the observed ionisation. After showing that the radiation produced on this hypothesis would have properties corresponding to those observed, Dr. Jeans concludes that "the bombardment by these rays provides an obvious explanation of the luminosity of such objects as the irregular nebulæ, as well as of the negative charge of the earth."

"Linaludo." — This is the name of a game, requiring much time and a good deal of patience, which has been produced by Mr. Archibald Sharp, B.Sc., A.M.Inst.C.E., F.C.I.P.A. It is based on the knight's move in chess, the idea being to touch upon each of a set of squares once only, and, if possible, to complete a circuit or "grand tour." The game is published by Messrs. E. Marlborough & Co., Ltd., at 4s.

Coal Commission.—Giving evidence before the Coal Commission on December 9th, Mr. Edmund Hann discussed with Mr. Evan Williams the subject of electricity supply to collieries, and is reported by the *Financial Times* to have expressed the belief that it was cheaper to transport coal than to transmit electricity over routes in excess of three miles.

Visit to Power Station.—On December 3rd members of the Taunton Traders' Association paid a visit to the borough electricity works, being conducted round the station by Mr. A. J. Howard, the borough electrical engineer, and his assistants. The invitation to view recently-installed machinery was extended by Ald. J. E. Kingsbury, the chairman of the Electricity Committee.

Appointments Vacant. — General fitter (£400), for the Government of the Gold Coast; electrical inspector (£600) for the Government of Nigeria; engineer clerk of works, for the Peterborough Corporation Electricity Department; junior shift engineer or improver for the Horsham U.D.C. Electricity Works; assistant in Mains Department for the Wolverhampton Corporation Electricity Department; electrical engineer (£480) for the Government of Nigeria Public Works Department. (See our advertisement pages to-day.)

The Electroplaters' and Depositors' Technical Society.—The first business meeting of this new Society was held at the Northampton Polytechnic Institute on December 9th, when Mr. S. Field delivered an address on the above subject as an introduction to the work of the session. Prof. F. G. Donnan, president of the Faraday Society, was in the chair. Mr. Field ascribes recent progress to the growing recognition among practical platers, of the inadequacy of rule-of-thumb methods, and to the consequent desire to found the art on sound scientific knowledge. Another factor, he says, has been the increasing applications of electrodeposition in many fields of industry, even in engineering practice. The day has passed when electrodeposition included nothing but silver and nickel plating and electrotyping, and we now have zinc, tin, lead, iron, cobalt, cadmium, and chromium, being commercially deposited. In other directions copper matrices are being deposited as moulds for gramophone records, and copper is also being deposited as wire for the prevention of carbonisation and in the manufacture of copper water-jackets. Iron and nickel are being deposited in the repair of iron parts of machinery, while cadmium is being used as a substitute for zinc in protecting against sea-water and similar corrosion. It is probable that chromium plating will become fairly general to render iron and steel non-corrodible, although the practical difficulties in the deposition of this metal call for care and knowledge.

Many problems remain to be solved. In the actual processes may be mentioned such difficulties as spotting-out, the appearance of pin-holes, and the exfoliation of deposits. Indeed, the whole subject of the relation between the mechanical properties of deposited metals and the constitution of the electrolytes used calls for systematic examination. What is it that conditions the adhesion of a deposit; what is the effect of neutral salts in solution, and why do colloidal additions in minute quantities have so extraordinary an effect on the properties of the deposit? There is obviously room for organised co-operative research in this branch of technology, and it is gratifying to learn that the Department of Scientific and Industrial Research has made a beginning in initiating such work at Woolwich and elsewhere. Finally, Mr. Field deals with the possibilities of standardisation in the electroplating industries, both as regards language and methods. May it not be possible, by means of concerted effort, to replace the multitudinous so-called formulæ now in use by a comparatively few and reliable compositions? It is evident that the new Society responds to a real need, and if by its discussions it leads to organised efforts in carrying out fundamental research, it will have performed a real service to a not unimportant branch of the electrical industry.

Roedean Schools Installation.—Since the publication of the reference to the recent electrical installations at the Roedean Schools, Brighton, in our issue of December 4th, we have been informed that "Walsall" metal-sheathed wiring fittings supplied by the Walsall Hardware Manufacturing Co., Ltd., were employed throughout the entire installation.

Road Surface Traffic Guide.—We are asked to state that the correct title of the firm responsible for the electrical installation in the "Illuminated White Line," described in our issue of December 4th, under the above heading, is British Electrical Installations Co.

Miners' Electric Lamps in France.—At a recent meeting of the Northern Section of the French Société de l'Industrie Minerale, M. Soulary read an interesting paper on the experience of the use of miners' electric lamps in the collieries of the Compagnie des Mines de Bruay, in the Pas de Calais Department. So satisfactory have they been that the company has now over 14,500 such lamps in use and is only retaining a sufficient number of oil lamps (about 2,700) to meet legal requirements.

The batteries are charged in groups of 100, a method which simplifies the electrical connections, and prevents any waste of current. No battery repairing is undertaken in the charging department, any accumulators which need repair being dealt with in a special shop. M. Soulary stated that, not only have the electric lamps proved successful, but they are also found to be more economical, their adoption by the company having resulted in an annual saving of about 800,000 francs. The increased use of electric lamps at the Bruay mines has enabled a reduction in the lamp trimming staff to be effected. Thus, whereas out of 13,110 lamps in use in June, 1922, only 6,316 (or about 48 per cent.) were electric, while 6,794 (or 52 per cent.) were oil, the total is now 17,172, of which the electric lamps' share is 14,431 (or approximately 84 per cent.) and the oil lamps' share 2,741 (16 per cent.). During the same period, notwithstanding an increase of 30.9 per cent. in the number of lamps, the number of trimmers required has fallen from 229 to 156, a drop of 31.8 per cent.; in other words, each man is now able to look after 110 lamps, as against only 58 when oil lamps preponderated.

The Electric Vehicle Committee of Great Britain.—RECONSTRUCTION OF COMMITTEE.—The Electric Vehicle Committee, formed in 1913 under the auspices of the Incorporated Municipal Electrical Association, has for some years been associated with the British Electrical Development Association. At a meeting held on June 20th, it was resolved to reorganise its constitution by forming a "Main Committee" representative of all interests concerned in the electric vehicle business, and composed of persons nominated by the various associations (or individually elected, where necessary); the Main Committee is to elect its chairman and to appoint a small Executive Committee. The former will meet quarterly, the latter monthly.

Starting from November, 1925, the following will hold office till March, 1927: Chairman, Mr. J. A. Priestley; vice-chairmen, Messrs. A. J. Makower and W. B. Worby Beaumont; hon. treasurer, Mr. J. Christie; past chairmen, Messrs. F. Ayton and R. A. Chattock.

The Main Committee includes representatives of nineteen societies or groups, of which the I.M.E.A. and the makers of electric vehicles have the largest numbers (7 and 6 respectively); the Committee when fully constituted will comprise 44 members. The Executive Committee consists of Messrs. A. C. Cramb, A. W. Blake, F. E. Gripper, F. W. Crawter, E. W. Curtis, F. Ayton, R. J. Mitchell, A. J. Makower, J. B. Osler, J. A. Priestley, and Col. R. E. Crompton.

We hope that the Electric Vehicle Committee, of which little has been heard for some years, will now enter upon a new era of well-directed activity. There is abundant scope for its labours.

Diesel-Electric Railway Traction.—With further reference to the note on the above subject on page 943 of our December 11th issue, our attention has been drawn to the fact that the electrical system adopted for the smaller of the two types of car in use on the Canadian National Railways was developed by the General Electric Co., of America, and carried out by the British Thomson-Houston Co., Ltd. It involved the design of generators having a special characteristic, with the object of eliminating control resistances and thereby saving space and obtaining higher running economy, which is of a substantial order, particularly over routes that include gradients, &c., and necessitate a large torque at a low speed for an appreciable proportion of the running time.

The main generators are designed for a speed of 700 r.p.m. and a terminal pressure of 600 volts, and are rated at 105 kW for two hours, with a temperature rise not exceeding 50 deg. C., or 85 kW continuously, with a temperature rise not exceeding 40 deg. C. On test, temperature rises were very low, and it was found that the machines were capable of an output of 105 kW continuously without dangerous heating. The exciters are shunt wound and of the overhung type, the frames being supported from the main generator end shields and the armatures carried on extensions of the main generator shafts; they are rated at 6 kW at a terminal pressure of 60 volts. A 16-cell battery of 450 ampere-hours capacity, which is charged by the exciter during the running periods, is provided for lighting, starting, and supplying power for contactor-closing coils, &c.

The main generators are provided with three windings on the main poles:—(*a*) A shunt winding separately excited from the exciter, (*b*) a winding connected in series with the battery across the exciter terminals, and (*c*) a differential series winding carrying the line current of the generator. By means of this combination, an extremely drooping volt-ampere characteristic is obtained which causes the demand for power from the engine over the working range to be substantially constant; on high gradients the torque required from the driving motors demands a heavy current from the generator, but as this is associated with a comparatively low voltage, there is no likelihood of stalling the engine. The engine is started up by means of a series-wound motor capable of exerting a torque equivalent to 45 h.p. at 200 r.p.m., and supplied from the battery, or alternatively, by means of the starting engine. The main driving motors are of the railway type, and can be connected in series or parallel by means of a controller of the usual traction type. There are no losses in starting and regulating resistances as the supply voltage, and therefore the speed, is controlled by the main engine throttle.

Science and Business.—Mr. A. P. M. Fleming, head of the Department of Education and Technical Research of the Metropolitan-Vickers Electric Company, delivered a lecture last week at the London School of Economics, under the auspices of the Commerce Society, on the subject of "Science and Business." He said, according to the *Financial Times*, that there was no industrial country in which there appeared to be such a lack of understanding between science and business as in Great Britain. Yet the scientist could not exist without the labours of the business man, and, on the other hand, no industry could make progress without continuous application of new scientific knowledge. Practically every phase of civilised life depended on the use of power. In this country we employed much less power than certain other industrial countries. This condition was changing, and it seemed likely that in the near future, with the interlinkage of electrical power systems, we might have power available under sufficiently economic conditions to extend its use very considerably. One of the problems of the future, and one on which civilisation would ultimately depend, would be the question of suitable electricity supply. It was increasingly necessary in this country to have a strong public well informed of the need for science and its underlying importance in all our business and national life.

Institution Notes.

Institution of Electrical Engineers.—INFORMAL MEETING.—On Monday, January 11th, 1926, at 7 p.m., a discussion on "The Electrical Installation at the Rockefeller Building, University College," will be opened by Mr. W. C. Clinton, B.Sc. On this occasion the meeting will take place at University College, Gower Street, London (refreshments at 7 p.m.). The X-ray and dissecting rooms and the library and museum of the Rockefeller Building will be open for inspection. The nearest stations to the College are:—Warren Street and Goodge Street (Hampstead Tube), and Euston Square (Metropolitan Railway).

At the informal meeting on Monday, December 7th, with Mr. P. Dunsheath, O.B.E., in the chair, Mr. C. L. Lipman opened a discussion on "The Design and Performance of Protective Relays." The opener showed a large number of lantern slides illustrating the operation and range of relays for all duties, and several types of the instruments described were on exhibition.

Dr. R. D. Gifford remarked that one of the great difficulties of the designer arose from the tendency of voltages to increase; with the consequent fall in current, transformers were almost at their winding limits.

Col. K. Edgcumbe said that in the United States, where until quite recently it was the practice to scoff at relays, they were now very much used and the larger supply authorities employed a "relay engineer," whose duty it was to inspect and maintain the automatic protective devices.

Mr. J. F. Shipley said that within the limits of reliability and safety there was no need for the expensive finish that was customary in English instruments. He had found in the United States that they were buying from the Continent in large numbers a robust type of relay with overload and inverse-time-limit features which cost considerably less than the highly-finished British article.

Many other members took part in the discussion.

IRISH CENTRE.—The advantages of harvesting peat by machinery was the subject of an interesting lecture on December 10th by Mr. James Lindsay in Dublin. He dealt in detail with the success of machinery driven by electricity generated from peat in the Turrann bogs in the King's County, and emphasised the importance of drainage to facilitate the setting up of plant on the bogs. Prof. Purcell paid a tribute to Sir John Griffith for the time and money that he had expended in endeavouring to make the peat industry the profitable undertaking it might easily be for all who were engaged in it.

SCOTTISH CENTRE.—At a joint meeting of the Scottish Centre of the Institution of Electrical Engineers and the Association of Mining Electrical Engineers (West of Scotland branch) in Glasgow on December 8th, a paper on "Electricity in Mines" was read by Major E. Ivor David. Dr. Magnus Maclean presided.

Junior Institution of Engineers.—On Friday last week Mr. J. S. Highfield, M.Inst.C.E., M.I.E.E., was inducted to the presidential chair by the retiring president, Dr. Alexander Russell, M.A., and delivered his inaugural address, which will be abstracted in our pages.

Institution of Mechanical Engineers.—In a paper on "Foundry Practice," read before the above Institution on December 11th, Mr. J. G. Pearce, B.Sc., said that to-day cast iron was regularly produced in foundry cupolas from a wide variety of raw materials with great consistence and economy. Certain applications which had temporarily been usurped by steel and other materials were reverting to cast iron, and in some developments, notably in internal combustion engineering, the development of the material was keeping pace with the growing demands of the designer. A paper was also presented by Mr. J. E. Fletcher on "Some Applications of Research to Modern Foundry Practice," in which he gave in detail some examples of the type of work and methods of attack used in applying the results of research in the foundry.

Institution of Production Engineers.—At a meeting held on December 16th, Mr. A. H. Mundey delivered a lecture on "Die-Casting."

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. E. W. ANDREWS, who has completed 25 years as head of the Sunderland branch of Messrs. F. Reid, Ferens & Co., of Newcastle-on-Tyne and Sunderland, has been presented by the workmen and officials with a combination cabinet. The workmen and apprentices of the Sunderland branch presented Mrs. Andrews with a silver trinket basket.

Reading Town Council has decided to increase the salary of the general manager and engineer of the tramways, Mr. CALDER, from £800 to £900 per annum, without bonus.

According to the *Australasian Electrical Times*, Mr. R. H. BARTLEY, chief engineer of the Auckland Electric Power Board, has been appointed to the position of general manager at a salary of £1,100 a year, and Mr. A. O. GLASSE has been appointed chief engineer in succession to Mr. Bartley.

Mr. H. KITCHEN, M.I.E.E., was entertained by his colleagues in the Northern Engineering District of the Post Office at the Central Exchange Hotel, Newcastle-on-Tyne, on Saturday, November 28th, when he was presented with a gentleman's wardrobe, on the occasion of his promotion to the position of assistant staff engineer, London. The gathering was representative of all ranks in the district. The chairman, Mr. J. R. M. Elliott, M.I.E.E., superintending engineer, in making the presentation, said that Mr. Kitchen was captain of the rifle team before the war, and he registered the highest score when Major O'Meara's cup was won by the district. He is a member of the Institution of Electrical Engineers, and for some years lectured on technical subjects at Rutherford College, Newcastle, and at Jarrow Technical School. He had always manifested a keen interest in the work and activities of the Institution of Post Office Electrical Engineers, and for a period of three years served on the main Council of the Institution.

Capt. H. SAUNDERS-JACOBS has been appointed assistant director of the Sheffield relay station of the B.B.C. After war service he was a member of the Military Inter-Allied Commission of Control in Germany from 1920 to 1922. He took a science degree at London University.

At the annual dinner of the Merthyr Electric Traction and Lighting Co., Ltd., held at Merthyr on December 3rd, Mr. F. J. Cursons, secretary of the company, presiding, Mr. LEWIS W. DIXON, the managing engineer, was presented with a solid oak writing table. It had been subscribed for by the staff and employés as a token of appreciation. Mr. Edward Rowlands, the chief clerk and cashier, who made the presentation, proposed the toast, "Our Chief," and in doing so referred to the growth of the business from small beginnings to its present operations supplying electricity over an area of nearly 30 square miles—but with the heavy burden of £6,000 per annum in rates! Mr. Dixon, who responded, has been manager of the company for 18½ years.

Shoreditch Borough Council Law and Establishment Committee recommends that Mr. C. NEWTON RUSSELL, the borough electrical engineer, be granted a retiring allowance of £510 as from December 19th, 1925 (the six months' extension of service expires on December 19th).

The fiftieth anniversary of the day on which Dr. H. A. LORENTZ took the degree of Doctor of Physical Science at the University of Leyden, was celebrated at Leyden last week, many noted scientists being present for that purpose, besides the Queen of Holland and the Acting Prime Minister, Mr. Colyn.

Obituary. — We are sure that many of our readers will desire to associate themselves with us in an expression of deep sympathy with Mr. HOWARD FOULDS, F.C.I.S., the secretary of Callender's Cable & Construction Co., Ltd., on the death of his wife, who passed away, after a long illness, at "Littlecomb," Caterham Valley, Surrey, on December 9th.

MR. A. P. BOLGER.—The death took place on December 8th, in his 57th year, of Mr. Alfred Patrick Bolger, who was a departmental manager at the works of Crompton & Co., Ltd., of Chelmsford. He had been with the firm for 31 years, and was formerly at the London office.

New Companies Registered.

Scientific Products, Ltd. (210,205).—Private company. Registered December 7th. Capital, £500 in 5s. shares. Objects: To carry on the business of scientific instrument manufacturers, factors and merchants, manufacturers of wireless apparatus, &c. The first directors are:—E. H. Newman (permanent), 237, Uxbridge Road, W.12; A. Grigg, 237, Uxbridge Road, W.12. Remuneration as fixed by the company. Registered office: 88/90, Chancery Lane, W.C.2.

Gaston E. Marbaix, Ltd. (210,252).—Private company. Registered December 10th. Capital, £1,000 in £1 shares. Objects: To carry on the business of importers, exporters, manufacturers, assemblers, equippers and repairers of and dealers in all wireless and telephonic apparatus, valves, instruments, equipment and accessories, electrical, mechanical and general engineers, &c. The subscribers (each with one share) are:—G. E. L. J. Marbaix, 50, Leyland Road, Lee, S.E.15, merchant; W. L. Bibley, 36, Brambledown Road, Wallington, accountant. The first directors are:—G. E. L. J. Marbaix (permanent governing director), and such other persons as shall be appointed by him. Solicitors: Frank Simmonds & Carter, 98, Salisbury House, London Wall, E.C.2. Registered office: 27/28, Anning Street, E.C.

Exe Valley Electricity Co., Ltd. (210,235).—Public company. Registered December 9th. Capital, £6,000 in £1 shares (4,000 preference and 2,000 ordinary). Objects: To carry on at Bampton and elsewhere in the Counties of Devon and Somerset the business of an electric light company in all its branches; to acquire the benefit, rights, powers, authorities, obligations, and liabilities of J. A. Purves in and under two agreements (1) with the Urban District Council of Bampton and (2) with A. Scott; and a lease between George and V. J. Burrow of the one part and J. A. Purves of the other part and a special order to be made by the Electricity Commissioners and known as the "Bampton Electricity Special Order, 1925," which is being applied for by J. A. Purves. Minimum cash subscription, £1,500. The first directors are:—J. A. Purves, Thorpe Hall, Eaton Rise, Ealing, engineer; Margaret M. Partridge, 16, East Southernhay, Exeter; F. W. Wescott, 42, Brook Street, Bampton, baker; J. Seward, Newton Square, Bampton, baker; F. C. Davey, 15 and 17, Fore Street, Bampton, saddler; B. M. Read, Castle Grove, Bampton, retired colonial civil servant; D. E. Green, The Vicarage, Bampton, engineer (managing director for three years). Qualification, 50 shares. Remuneration of managing director, £150 for first year, £200 for second year, and £250 for the third year, and a percentage of the profits. Solicitors: Joyce, Risdon and Hosegood, Williton, Taunton. Registered office: 27, Brook Street, Bampton, Devon.

R. R. Goding, Ltd. (210,116).—Private company. Registered December 5th. Capital, £3,000 in £1 shares. Objects: To acquire the business carried on at 42, Gray's Inn Road, W.C., as the National Wireless and Electric Co., to adopt an agreement with R. R. Goding, and to carry on the business of manufacturers of, and dealers in wireless and electrical goods, wireless, electrical, mechanical, and general engineers and contractors, &c. The directors are:—R. R. Goding, 20, Chatsworth Gardens, Acton, W.3, wireless engineer (permanent managing director); A. N. Entwistle, West View, West Moors, Dorset, wireless engineer. Qualification, 50 shares. Remuneration as fixed by the company. Secretary: A. N. Entwistle. Registered office: 42, Gray's Inn Road, W.C.1.

Jemco, Ltd. (210,197).—Private company. Registered December 7th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers of insulated and other wire, cables, and all electrical apparatus and appliances, electrical and general engineers, &c. The first directors are:—Mrs. Mary C. Smith, Stowfield House, Lydbrook, Glos.; Miss Muriel C. Smith, Stowfield House, Lydbrook, Glos. Qualification, £25 shares or stock. Remuneration (if any) as fixed by the company. Solicitors: Rooke & Sons, 45, Lincoln's Inn Fields, W.C.2. Registered office: Lydbrook, Glos.

British Hard Rubber Co., Ltd. (210,166).—Private company. Registered December 5th. Capital, £6,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in hard rubber, ebonite, vulcanite and any other plastic substances or compositions and articles made therefrom; chemical, textile, electrical, mechanical and general manufacturers and engineers, manufacturers of and dealers in radio and electrical instruments, &c. The subscribers (each with one share) are:—Joan Peachey, 9, Hetley House, Hetley Road, W.12, stenographer; V. Deighton, 97, Junction Road, Highgate, N.19, solicitor's clerk. P. E. Wells is to be one of the first directors and shall be permanent chairman. Qualification of first directors, 1 share; of other directors, 100 shares. Solicitors: A. Blackman, Hailey & Co., Gresham House, Old Broad Street, E.C.2. Registered office: Wharf Road, Ponders End, Middlesex.

Milton and Barton-on-Sea (Hants) Electrical Supply Company, Ltd. (210,162).—Public company. Registered December 5th. Capital, £15,000 in £1 shares. Objects: To carry on at Milton and Barton-on-Sea, in the Rural District Council of Lymington, Hants., the business of an electric light company in all its branches, and to adopt an agreement with A. R. Musgrave for the carrying out of an order made by the Electricity Commissioners under the Electricity (Lighting) Acts, 1882-1922 in respect of the parish of Milton, for taking a transfer of an undertaking and the said order. Minimum cash subscription, 10 per cent. of the amount offered. The directors are:—A. R. Musgrave, Grove Lodge, Isleworth, Middlesex, soap manufacturer; Mrs. Margaret A. Musgrave, same address. Qualification, 500 shares. Remuneration as fixed by the company. Secretary: Mrs. M. A. Musgrave. Solicitors: Moore, Vicary & Trestrail, 38, High Street, Lymington and New Milton. Registered office: Milton, Hants.

James & Venables, Ltd. (210,265).—Private company. Registered December 10th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of manufacturers of, and dealers in wireless products of all kinds, speedometers, clocks, brake and clutch linings, motor accessories, tobacco, cameras, and fancy goods, &c. The directors are:—E. H. Cully, 3, The Drive, Hove, Sussex; W. O. Carroll, 12, Great Queen Street, W.C.2. Qualification, 1 share.

Official Returns of Electrical Companies.

W. R. Harding & Co., Ltd.—H. J. Herbert, of 172, Bishopsgate, E.C.2, was appointed receiver and manager on November 21st, under powers contained in debenture dated June 12th, 1925.

New System Private Telephone Co., Ltd. (73,732).—Capital, £20,000 in £1 shares. Return dated May 5th, 1925. 15,000 shares taken up. £13,000 paid. £2,000 considered as paid. Mortgages and charges, nil.

Modern Electrical Supply Co., Ltd.—F. S. Wilks, of 31, Lombard Street, E.C.3, ceased to act as receiver or manager on November 30th, 1925.

Rowland Edwards & Co., Ltd.—Debenture dated November 30th, 1925, to secure £600, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Mrs. B. K. Sharman, 51, Madrid Road, Barnes.

Church Stretton Electric Supply Co., Ltd.—Satisfaction to the extent of £250 on October 20th, 1924, to the further extent of £250 on May 12th, 1925, and to the further extent of £250 on November 13th, 1925, of charge dated January 29th, 1921, securing £1,550.

Auto Welding and Engineering Co., Ltd.—A. H. P. Howard, of 46, Peartree Street, Goswell Road, E.C.1, ceased to act as receiver or manager on November 13th, 1925.

Harry Morser & Company (Wireless), Ltd.—Debenture dated November 30th, 1925, to secure £1,500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: H. W. D. Gallwey, Winchester House, Kingston Hill, Surrey.

Betax Manufacturing Co., Ltd.—Debenture dated November 16th, 1925, to secure £2,000 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Ben Tax, 21, St. Vincents Road, Westcliff-on-Sea.

Eclat Electric Manufacturing Co., Ltd.—E. M. Carrington, F.C.A., of 2, Gresham Buildings, Basinghall Street, E.C.2, ceased to act as receiver and manager on November 30th, 1925.

R. M. P., Ltd.—Mortgage debenture bond, dated November 27th, 1925, to secure £307, charged on the company's undertaking and property, present and future. Holder: G. P. Power, Adderley Road, Saltley, Birmingham.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Foundation Co., Ltd.

The annual meeting of this company was held on December 9th, Mr. A. W. Tait, C.B.E., presiding. In presenting the report and accounts the chairman made mention of a number of important contracts which had been entrusted to the company. During the year the principal contracts obtained were:—The City and South London Railway extension to North Morden; escalators at Tooting, South Wimbledon, and Colliers Wood; transmission lines for the North Wales Power Co.; mast foundations for the Marconi Co. (Australia); and tramway construction for the Melbourne Tramways Board. Work was also in hand for the following:—The London Electric Supply Corporation, Deptford; the Yorkshire Electric Power Co., Ferrybridge power station; the Borough of Woolwich; the South Wales Power Co.; and the Mid-Cheshire Electric Supply Co. An arrangement had been made with the parent company for direct participation and incidental assistance in contracts obtained by that company and its associates in Europe, Asia and Africa, other than British territory. For the purpose of assisting in the finance of contracts in the territory referred to a new company had been formed in America with a paid-up capital of $3,000,000. The parent company had also recently increased its capital by $1,200,000. The company itself intended to raise its capital from £250,000 to £350,000 by the creation of ordinary £1 shares, ranking *pari passu* with the existing ordinary shares. The business was satisfactory and they hoped that it would continue to expand and that its connections would increase. The report and accounts were adopted and at a subsequent extraordinary meeting the proposed increase in the company's capital was approved.

The Vickers Reorganisation Scheme.

Last week the advisers appointed by Vickers, Ltd., to inquire into the company's affairs and make recommendations regarding reorganisation (Mr. Reginald McKenna, Mr. F. Dudley Docker, and Sir William Plender, Bart.) made a lengthy report, which the board has endorsed, and it is intended to carry the recommendations into effect. The investigators found that the earning capacity of the company and its allied undertakings had greatly decreased in recent years and that it appeared unlikely that the position would improve sufficiently to allow of the payment of dividends on the existing ordinary share capital. It was also found that the value of many of the assets was considerably below the figures at which they stood in the company's accounts. The company was also under heavy contingent liabilities for which no specific provision had been made and might be expected to result in actual liabilities upon the company. It is therefore recommended that the ordinary share capital be written down from £12,315,483 to £4,105,161 (*i.e.*, the £1 shares will be reduced to 6s. 8d.); that £3,600,000 be appropriated from the reserve fund; and that £632,044 be appropriated from the balance standing to the credit of the profit and loss account. This sum (£12,442,366) will be utilised in writing down the land, buildings, &c., by £4,254,994; the book value of the company's interest in subsidiary companies by £5,488,316; and the book value of the marketable securities, &c., in hand by £472,150; the balance (£2,271,906) will be used to create a reserve to meet contingent and other liabilities not provided for. The causes of the company's loss are stated to have been:—(*a*) The general depression in trade; (*b*) Depreciation in foreign exchanges; (*c*) Reduced earning capacity attributable to: (1) The world reduction in armament expenditure; (2) the home production of armaments by foreign countries; (3) the decline in shipbuilding; (4) foreign competition in world markets; and (5) financial stringency and political unrest in Europe, which has restricted the giving of credit and retarded schemes of development. Other causes of a different nature which have contributed to the position are the lack of special experience in the management, necessary to control so large and varied a body of industrial undertakings; and the entering into investments which have not only proved unremunerative but are now the subject of considerable liability. It is therefore proposed that some of the present directors should retire to provide vacancies on the board for new members. It is recommended that, in addition to the reconstituted board of directors, there should be three management boards, *viz.*, an industrial board; an armaments and shipping board; and a finance board. It is suggested that the remuneration of the directors should be limited; that superfluous officials should be discharged; that all unremunerative subsidiaries should be wound up, &c. The principal subsidiaries are the Metropolitan Carriage, Wagon and Finance Co. and the Metropolitan-Vickers Electrical Co., Ltd., both of which have been profitable. Other electrical (or partly electrical) concerns in which the company is interested are Vickers-Petters, Ltd., the British Lighting & Ignition Co., Ltd., W. T. Glover & Co., Ltd., the Ioco Rubber & Waterproofing Co., Ltd., Electric & Ordnance Accessories, Ltd., and Adam Hilger, Ltd. In accordance with the request of the board, Messrs. McKenna and Docker, and Sir Wm. Plender have agreed to continue to act in a consultative capacity until the board has been reconstructed and the three suggested boards are functioning. The directors point out that while the proposed reduction of capital is drastic, it is in effect only a book entry and each ordinary shareholder will continue to hold exactly the same *pro rata* interest in the company which he now holds.

An extraordinary general meeting was to be held yesterday (Thursday) at Sheffield to give effect to the recommendations. It was to be proposed that the capital should be reduced from £26,500,000 to £18,289,678 by cancelling paid-up capital to the extent of 13s. 4d. on each of the existing 12,315,483 ordinary shares, and that each of the 5,684,517 unissued ordinary shares should be subdivided into three shares of 6s. 8d. each.

French Companies.

The *Société d'Applications Industrielles* (*Compagnie d'Entreprises Electriques*), of Paris, earned net profits of 4,278,000 fr. in 1924-25, and has declared a dividend at the rate of 12 per cent.

The *Société des Etablissements de E. C. Grammont et de Alex. Grammont* reports gross profits amounting to 21,746,000 fr. for 1924-25 as compared with 17,713,000 fr. in the previous year. It is proposed to apply the net profits to writing off various amounts, whereas in 1923-24 a dividend at the gross rate of 6 fr. per share was distributed.

The *Compagnie des Exploitations Electriques* states that the net profits increased from 1,405,000 fr. in 1923-24 to 1,943,000 fr. in 1924-25, and the dividend is at the rate of 17.50 fr. per share on share capital of 25,000,000 fr., as compared with the same rate on 18,000,000 fr. in 1923-24.

Austrian Company.—The report of the Oester. Siemens Schuckert Werke, for 1924, which has only just made its appearance, complains of lower sales caused by the economic crisis and the high taxes and social burdens. The absence of adequate orders to permit of the mass production of motors and other electrical goods was partly compensated for by the large orders for hydro-electric plant and electric railway equipment, and these orders have again been considerable in the current year. The net profits in paper crowns in 1924 were twice the amount of those in the previous year, and the rate of dividend rises from 2,000 crowns per share in 1923 to 4,000 crowns last year.

Dutch Company.—PHILIPS' LAMP WORKS.—The *Financial Times* correspondent at Amsterdam reports that the company is issuing 3,500,000 ordinary and 1,125,000 preferred shares, at 150 and 110 per cent. respectively, to present shareholders. This raises the capital of the company to 17,500,000 guilders in ordinary shares and 5,625,000 guilders in preferred shares.

British Columbia Electric Railway Co., Ltd.—The report for the year ended June 30th last shows a profit of £360,792, after providing for debenture interest, &c. Final dividends at the rate of £2 9s. 3d. on the preferred ordinary shares (making £6 6s. 9d. per cent.) and at the rate of £4 2s. 6d. on the deferred ordinary shares (making £8 per cent.), all free of tax, are recommended. The meeting is to be held on December 23rd.

Victoria Falls & Transvaal Power Co., Ltd.—The directors have declared a dividend of 3 per cent. for the half-year ending December 31st, and a further dividend of 3 per cent. in respect of participating rights for the year ending December 31st, on the preference shares. A dividend of 3 per cent. has also been declared on the ordinary shares.

Armstrong, Whitworth Development Co., Ltd.—Out of profits of £97,152 for the year ended September 30th last the company is paying a dividend of 15 per cent., free of tax, on the ordinary shares (as in 1923-24) and carrying forward £31,291, as compared with £11,640 brought in.

Manila Electric Corporation.—The financial Press reports that there is growing opposition to the offer of the Associated Gas and Electric Co. to exchange its 6½ per cent. obligations for Manila shares.

Power-Gas Corporation, Ltd.—There was a profit of £12,315 for the year ended September 30th last. The directors propose to transfer £2,000 to reserve, to pay a dividend at the rate of 4 per cent., and to carry forward a balance of £19,598.

Eastern Telegraph Co., Ltd.—A third quarterly interim dividend of 2½ per cent. on the ordinary stock, free of tax, is announced.

Eastern Extension, Australasia & China Telegraph Co., Ltd.—A dividend of 5s. per share, free of tax, has been declared in respect of the quarter ended September 30th last.

W. & T. Avery, Ltd.—A half-yearly dividend at the rate of 5 per cent. has been declared on the ordinary shares.

Stocks and Shares.

Monday Evening.

With Christmas so closely at hand, and with timorous apprehensions expressed about the Bank Rate, the Stock Exchange markets cannot expect to attract much business outside the area covered by the rubber share section. The rubber market remains remarkably active and tolerably strong. An occasional reaction may arouse the impression that the boom is over, and that quieter conditions are about to prevail, but the strength is quickly recovered, and prices go ahead again. This week's settlement in rubber shares is one of the heaviest on record, and money to pay for its purchases has to be found, to some extent, by the sale of securities elsewhere—a factor which adds a contributory cause to the reasons that make for dulness in other markets.

The electricity supply department is firm, the feature being a rise of 2s. 6d., to 60s. 9d., in County of London ordinary. Various rumours came into circulation to account for this, but the real reason has yet to be revealed, although it may be made public before these paragraphs appear. City of London lost 1/16 of their last week's advance; otherwise, the prices are good. Buyers of the shares frankly admit that they desire to discount the day of distribution of capital reserves. The cautious observer may deem this as, possibly, premature. He would urge that it might be well to await some definite indication of the manner in which the reserves are to be valued. However, the investor evidently considers that the outlook is sufficiently assured to justify him in the present purchase of shares in this list, and prices are hard in consequence of a persistent demand.

Brazilian Tractions stand out with a gain of 7 points, on the increasing favour with which the company's prospects are regarded. Brazilian tramway issues have not changed to any material extent. An interesting issue was made in New York last week, when ten million dollars of 6½ per cent. gold debentures in the Allgemeine Elektricitäts Gesellschaft, were offered at 94. Allowing for redemption in 1940, the yield at this price is 7⅛ per cent. on the money.

Victoria Falls Power shares gave way upon news of an explosion having occurred on the property, but the decline was recovered upon declaration of an interim dividend on the preference shares at the same rate as that of last year. The price is now 33s. 9d., and the ordinary are quoted at 52s. Two of the company's machines were quickly restarted, thus ensuring a normal supply of power to the mines for 18 hours a day.

Falls are marked against some of the cable and electrical manufacturing shares, but, on the other hand, a few improvements occurred. Telegraph Constructions gained 10s.; the price has barely moved throughout the recent period of rising prices in this market. Callenders have gone back to 3¼ and Electric Constructions to 1⅝; Siemens drooped to 32s. English Electrics lost a trifle at 19s. 3d. Brush shares hold their gain at 26s. 3d., Edisons hardened to 9s. General Electrics fell 6d. to 23s. 6d. Cromptons at 15s. are 1/16 up. International Automatics keep close to £2, and Automatic Telephones at 51s. 3d. have parted with 1s. 6d. of their recent jump.

Vickers announce a drastic scheme of reorganisation, the directors proposing to write off 13s. 4d. per share from the ordinary, and so to reduce these shares to the nominal value of 6s. 8d. each. The price promptly put on 1/16, strengthening to 8s. 1½d., thanks to the hope that this plan, if carried through, may bring the shares within sight of a dividend once more. Nothing has been paid on them since May, 1923. Several other companies in this group are expected to follow suit.

United River Plate Telephones have gone up 3s. 9d., to 7 11/16, and the market is a hard one as a whole. Globe ordinary rose ¼, to 18½, Great Northerns fell back to 34. The wireless shares fail to make headway, or to attract public attention. Marconis are 22s. 6d. and Canadians 5s. As previously noted, wireless shares have been turned out by some of the holders who wanted to exchange into rubber shares. The Marconi dividend time is approaching, and some nervousness is entertained lest the previous 10 per cent. may be cut in the forthcoming distribution.

Home Railway stocks are dull and uninteresting. Metropolitan slipped back a point to 69. This is the season at which, normally, investment takes a hand in the Home Railway market, but the public nowadays declines to evince any interest. The National Wages Board decision makes little difference to the position as it has been standing already.

British Insulated, ex rights, are nominally 17s. 6d. down: the value of the new shares makes up for the deduction. On the assumption that the 15 per cent. dividend will be maintained upon the increased capital, the yield on the shares now works out to a little under 5½ per cent. The rubber share market continues to absorb lively public interest. A disposition to take profits is, however, noticeable and the boom begins to look a little tired. The which is not altogether surprising, having regard to the furious pace at which the movement has proceeded during the past three months.

Share List of Electrical Companies.

Electric Vehicles in France.

Some Particulars of the Renault Sight-seeing Cars.

DURING the past few years, as a result of the activities of the Société pour le Developpement des Véhicules Electriques and as an outcome of the annual trials which are being held, there has been a marked increase both in the construction and use of industrial electric vehicles in France. A firm which has hitherto been chiefly associated with petrol vehicles, but which is, in conjunction with the Société Alsacienne de Constructions Mécaniques, of Belfort, which is responsible for the electrical equipment now turning out electric trucks, 'buses, and sight-seeing vehicles is Renault Frères, of Billancourt, Paris. A number of the last-named cars have been employed during the past few months in conveying visitors round the Decorative Arts Exhibition in the French capital in the same way as the Railodok cars were used at Wembley.

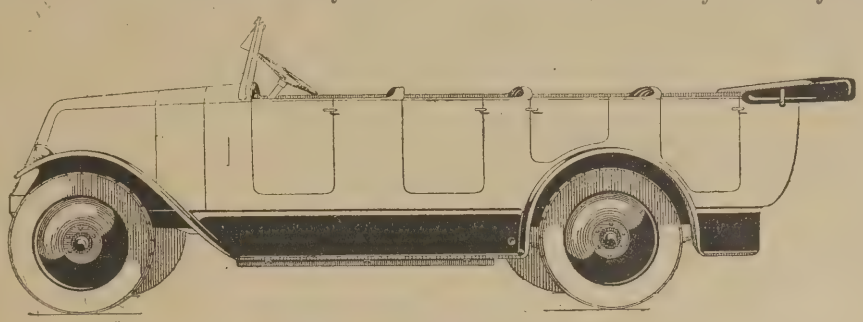

Fig. 1.—Renault Electric Car.

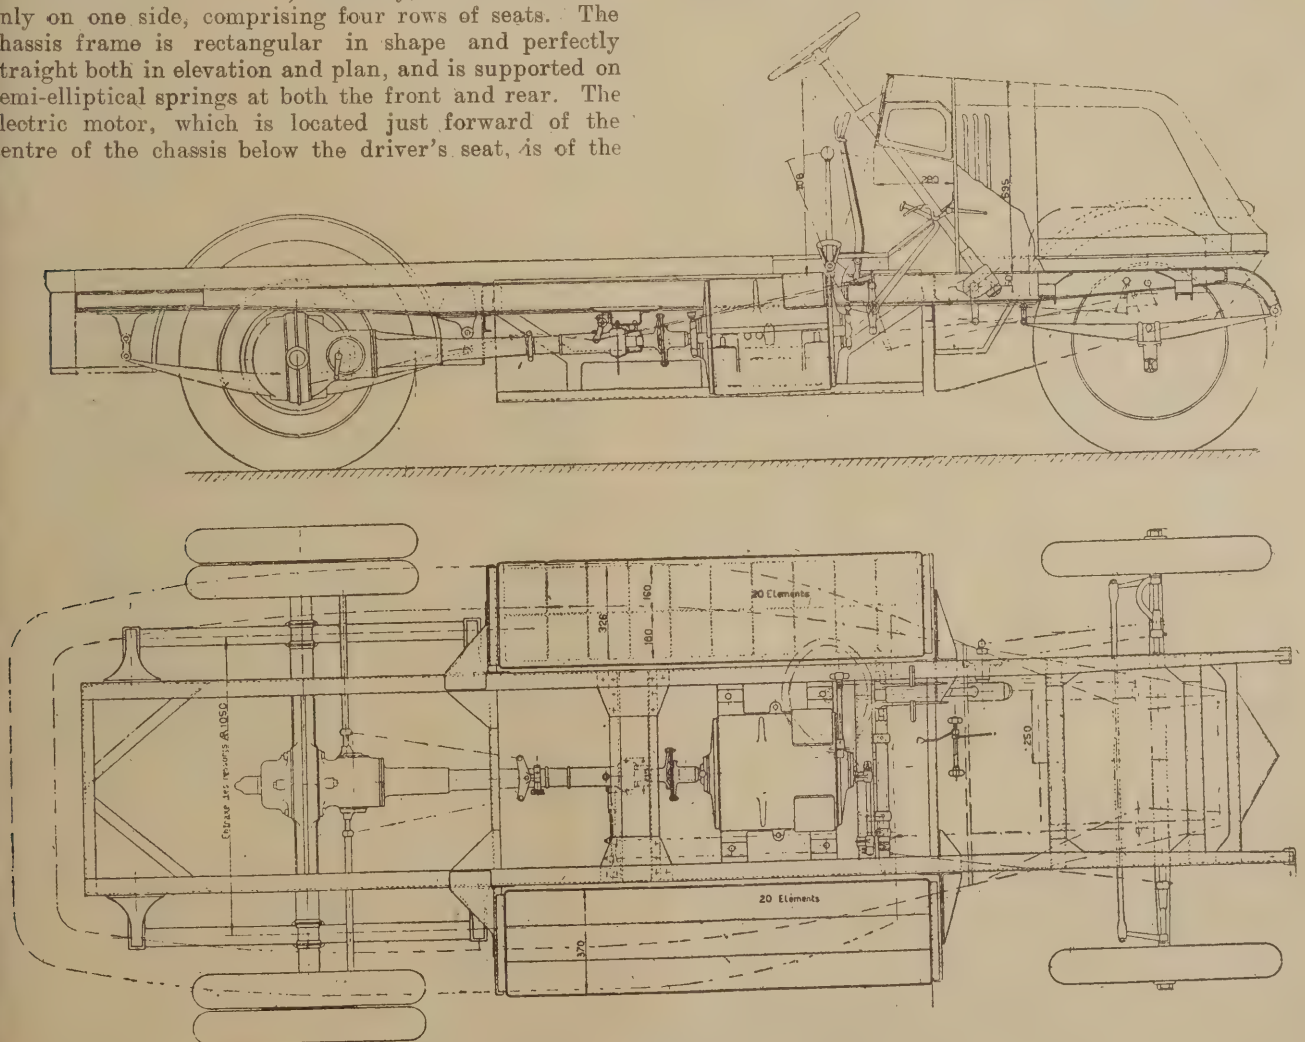
The vehicles are designed to carry eleven passengers, in addition to the driver, the body, which has doors only on one side, comprising four rows of seats. The chassis frame is rectangular in shape and perfectly straight both in elevation and plan, and is supported on semi-elliptical springs at both the front and rear. The electric motor, which is located just forward of the centre of the chassis below the driver's seat, is of the four-pole self-exciting type, with auxiliary commutating poles. It normally develops 5 h.p. at speeds ranging between 750 and 3,350 r.p.m., and is connected with the rear axle through a flexible coupling, enclosed propeller shaft, bevel and reduction spur gearing. The motive power is supplied by a battery of 40 lead accumulator cells arranged in two boxes containing 20 cells each and carried along the sides of the vehicle. The capacity is 210-230 amp.-hours at the 5-hour discharge rate, enabling the vehicle to cover a distance of about 56 miles on one charge. The battery boxes are secured in such a way that they can be detached and carried away on a special trolley for replacement purposes, or the cells can be charged *in situ*.

The electric control gear is readily accessible, being located under a standard Renault bonnet, and comprises an automatic cut-out which breaks the main circuit in case of overload; a lever giving neutral, forward, and reverse speed positions; a set of starting resistances; a field rheostat acting on the shunt winding, and enabling the speed of the vehicle to be varied between $3\frac{3}{4}$ and $18\frac{3}{4}$ m.p.h.; a battery-charging connection, and a lamp which warns the driver when the load on the battery exceeds a predetermined value. The vehicle is driven exactly as is a petrol car, the driver having at his command a starting pedal, a pedal accelerator, and foot- and hand-operated brakes. The foot brake acts on all four road wheels, whereas the hand lever acts only on the rear wheels. Interlocks are provided so that as the hand brake is applied, the battery-motor circuit is broken.



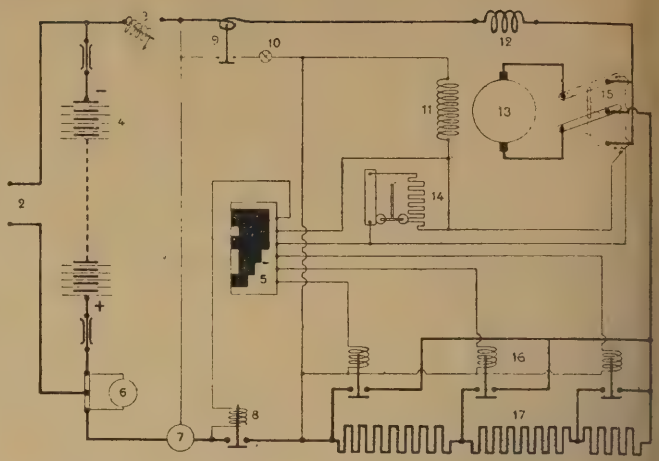


Fig. 2.—Elevation and Plan of Chassis of the Battery-propelled Charabanc.

The road wheels are of the disk type, shod with 820 by 120 mm. pneumatic tires, twins being fitted at the rear. The weight of the chassis is given as two tons, and that of the battery as between 16 and 18 cwt. Including the body, the vehicle is designed to carry a total load of about a ton. It may be added that the steering gear is mounted on the left side of the vehicle, and that the wheelbase is 10 ft. 6 in., with a track width of 4 ft. 9 in.

In view of the improvements that have been made in the manufacture and operation of storage batteries in recent years, and the experience that has been gained with public service vehicles at Wembley and at the Paris Exhibition, it is somewhat surprising that so few electric battery vehicles are employed for passenger transport. The fact that some of the pre-war experiments in this direction had unfortunate results should not prove a bar to further trials; the difficulties met with in the early days of the petrol-driven motor-car were triumphantly overcome, and the success of the commercial battery vehicle suggests that a good case might be made out for the passenger car, which for convenience, reliability, and ease of control is without a rival.

A Review of the Principal Exhibits of Electrical Interest.

(*Concluded from page 931.*)

Echo Depth Sounders.

An "earth inductor" compass was an interesting item on the stand of Henry Hughes & Son, Ltd., who also exhibited sonic echo depth-sounding apparatus, which can now be used by the merchant service under British Admiralty licence. The system (Mr. F. E. Smith, F.R.S.) depends on the indirect measurement of the time interval between the production of a sound wave under water and its reflection from the sea bed. The source of sound is a steel diaphragm fixed to the hull of the ship that is set in vibration by a spring hammer, which is withdrawn from the diaphragm by a solenoid, the circuit of the latter being broken automatically every half second. The note emitted has a frequency of 1,250 per second, and when immersed in water the diaphragm is heavily damped, so that the energy communicated to it by the hammer is quickly transferred to the water. The receiving hydrophone is a simple microphone enclosed in rubber and immersed in the water; it is comparatively aperiodic, and in the vessel a $\frac{1}{8}$-h.p. electric motor, running at 1,800 r.p.m. (fig. 12) drives two switches through 10 to 1 reduction gear. Constancy of speed within 1 per cent. is obtained in spite of large variations in the supply voltage by a special centrifugal friction governor. One of the switches, which consists of a pair of brushes in contact with a rotating disk provided with an insulated segment breaks the 100-volt d.c. supply to the transmitter every third of a second for a period of about 0.0025 second. The other switch, running on the same shaft as this disk, short circuits the telephones in the receiving circuit, except as determined by the position (relative to the corresponding pair of brushes) of a second insulating segment. When, therefore, the apparatus is running no sound will be heard in the telephones unless the insulating segment in the telephone switch happens to open the telephone circuit at the instant when the transmitter is actuated, or at the instant when the echo returns from the bottom of the sea. By a simple mechanism the position of the brushes in the telephone circuit can be displaced by hand relative to the corresponding pair of brushes in the impulse circuit, so that an interval of time, proportional to the angular displacement of the brushes, intervenes between the emission of an impulse by the transmitter, and the opening of the telephone circuit. If a sound is heard in the telephone, the angular displacement of the brushes gives a measure, in terms of the known speed of rotation of the switch, of the time taken by the sound to travel from the transmitter to the receiver—a distance which is approximately double the depth of water, depth being read directly on a dial.

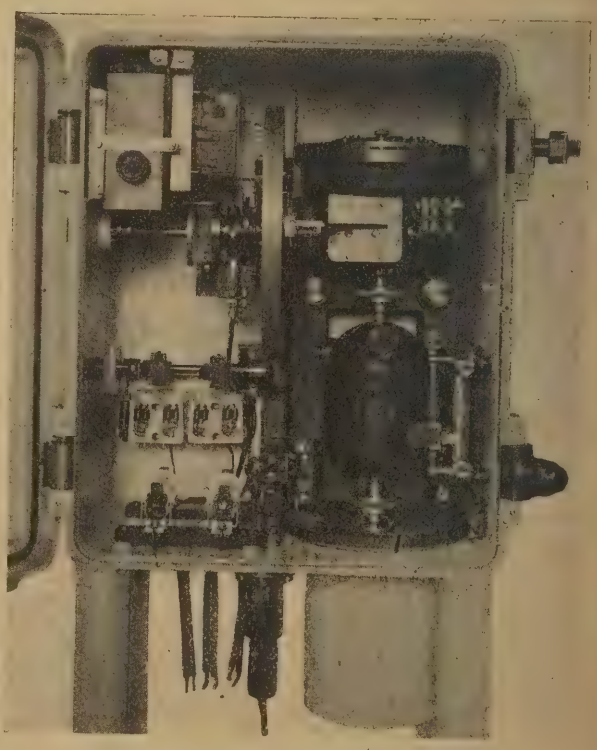

Fig. 12.—Depth Sounder Recording Mechanism.

Another depth sounder (Herr Behm, Germany) was shown by Kelvin, Bottomley & Bird, Ltd. The outfit comprises a time-interval recorder capable of measuring to a 1,000th part of a second; a small cartridge is discharged into the water, which detonates a few feet below the surface, setting up a sound-wave that jogs a "starting" microphone sufficiently to release the recorder.

The sound-wave eventually reaches a second microphone, after reflection at the sea bottom. The effect on the echo-receiving microphone is to stop the recorder, the time-interval being so short that the pointer appears to spring from the zero position on the scale to that indicating the true depth instantaneously. As a rule, the starting and the echo-receiving-microphones are on opposite sides of the ship, but when the ship's hull does not form a sufficient screen to enable the receiving microphone to be protected from the direct action of the detonating cartridge, the recorder is provided with a relay which interrupts the circuit long enough to allow the sound-wave which would have reached it by the shorter path to die away. The receivers are fixed internally hard up against the ship's plating, but without the necessity of drilling the hull. The cartridge is discharged into the sea electrically from the deck rail. Such instruments as electric engine-room telegraphs; loud-speaking telephones; helm, look-out, and navigation lights indicators were displayed by Siemens Bros. and Co., Ltd., and luminous signalling systems by the Sunderland Forge & Engineering Co., Ltd.

Engine Room Auxiliaries.

As representing engine-room and boiler accessories the collection of electrical CO_2 and CO recorders, draught and pressure gauges, thermometers and automatic temperature regulators, &c., exhibited by the Cambridge Instrument Co., Ltd., may be instanced. Water, steam, gas meters and recorders were seen on the stand of Geo. Kent Ltd., and the Electroflo Meters Co., Ltd. A double suspension furnace arch spanning two Bennis chain-grate stokers was shown by Liptak Furnace Arches, Ltd., as well as an interlocking air-cooled pulverised-fuel combustion chamber wall, while Edward Bennis and Co., Ltd., exhibited a graded forced-draught cellular chain-grate stoker complete; unlike usual practice, the electric fan furnishes air at comparatively high pressure to a Veni contractor, in which is induced a larger amount of air at a lower pressure. Steam air ejectors and condensate pumps were on the stand of John Musgrave and Sons, Ltd.; coal meters and water recorders were exhibited by the Lea Recorder Co., Ltd., economisers and accessories by E. Green & Son, Ltd., and boiler-house plant by Babcock & Wilcox, Ltd.

Boiler appliances featured by James Gordon & Co., Ltd., included an electrical water-level indicator and alarm which does not need the installation of apparatus inside the boiler drum, being operated by a thermostat such as is used with a Copes feed-water regulator.

Quantameters, Ltd., showed a form of water-level indicator that was brought out by the Aster Engineering Co. about a year ago. The device has no internal friction, depending on the choking effect of an alternating-current coil on a copper float that rests on a mercury bath which is balanced against the head of the liquid, the level of which is to be indicated. The indication is given at any distance by a voltmeter calibrated in feet, and it will be realised that the instrument measures quantity and not merely height, whilst its action being dependent on hydrostatic pressure, changes in specific gravity caused by variations in temperature do not influence its readings. The principle of this interesting gauge is applicable in a variety of ways.

Electric Trucks and Batteries.

Battery-driven trucks are, of course, much used in docks and warehouses, and they were represented on six stands, namely, those of G. D. Peters & Co., Ltd., R. E. Seal, Ransomes, Sims & Jefferies, Ltd., H. C. Slingsby, British Electric Vehicles, Ltd., and Joseph Booth and Bros., Ltd. Three stands were devoted to electric accumulators of the Chloride, Edison, and "Nife" makes.

Miscellaneous Exhibits.

Under this heading something like two dozen stands could be included; for instance, the Artofex Engineering Works, Ltd., included in its exhibits electric dough-mixing machines and cake mixers, and baking ovens of the sectional type. The Hotpoint Electric Appliance Co., Ltd., also had a range of electric heating and cooking devices, and vacuum cleaners were demonstrated by Electrolux, Ltd.

C. A. Vandervell & Co., Ltd., showed cabin lighting, engine starting, and ignition apparatus for small cabin cruisers and fast craft, starters for engines up to 250 h.p. being exhibited with suitable batteries, together with an automatic lifeboat safety lighting system, projectors, and electrical accessory fittings. Magnetos and engine starters were also shown by Simms Motor Units (1920), Ltd. W. G. Walker & Co. showed fan-brake dynamometers for testing motors, ventilating fans, and coil windings. Electric clocks and wind vanes, &c., were on the Magneta Time Co.'s stand, and photo-printing apparatus was shown by J. Holden & Co., Ltd., and also the Precision Photo Printing Plant Co. M. W. Woods exhibited fans, motors, rotary converters, and rectifiers, and Isenthal & Co., Ltd., control gear. The London Electric Wire Co. & Smiths, Ltd., needs no introduction; "Hollerith" electrical tabulating and sorting machines are products of the British Tabulating Machine Co. The display of the West Insulating Co. is indicated by its name, and electric furnaces were on view on the stands of Rustless Surf-Alloy, Ltd. (whose process consists of rustproofing iron and steel by alloying the surface with zinc), and of Automatic & Electric Furnaces, Ltd. (Wild-Barfield).

An All-Electric House.

Detailed Particulars of a 10-Room Glasgow Dwelling.

By Prof. S. PARKER SMITH, D.Sc., M.I.E.E.

(Abstract of Paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

(Concluded from page 952.)

Hot Water.—It is possible to use small tanks or geysers in different parts of the house and so avoid all pipe losses, but an adverse critic might regard such a method as a makeshift. The arrangement in the present case is really due to Mr. R. B. Mitchell, who emphasised the desirability of developing new forms of night load. No better occasion offers itself for this purpose than heat storage in water. It was therefore decided to take energy for heating water between 11 p.m. and 7 a.m. Since the consumer's share of the capital charges is included in the two-part tariff, running charges will form practically the entire cost. The average running charges at Dalmarnock station are of the order of 0.25d. per kWh and the charge of 0.375d. per kWh proposed by Mr. Mitchell for domestic hot-water storage during night hours should therefore become popular. In order to make the experiment successful, however, it was necessary to obtain a well-lagged tank, which proved to be a difficult task. The author co-operated with Mr. Duncan Low, of Messrs. Arch. Low and Sons, of Glasgow, and tests were made with different forms of lagging until it was found that with a suitable application of cork the fall in temperature of the water was less than 1 deg. F. per hour. Further, it was found that by proper design the amount of mixing of the incoming cold water with the hot water in the tank could be made negligible. The tank, fed from the cistern, has a cubical capacity of 87 gallons, and supplies the bath and hand-basin in the bathroom, the maid's room, pantry, cloakroom, and three points in the kitchen. Near the bottom of the tank there are immersion heaters rated for 4 kW, 2 kW, and 1 kW. Near the top of the tank there is an emergency immersion heater rated at 2 kW, which auxiliary heater has proved to be very serviceable when the demand for hot water has been exceptional and the temperature has fallen too low for domestic purposes. For instance, it will heat up sufficient water for a 35- to 40-gallon warm bath in 30 to 60 minutes, according to the water temperature when switching on.

The tank thermometer is calibrated "high," "medium,"

and "low," to indicate in which position the switch has to be placed in the evening; in winter it is mostly necessary to place the switch at night in the "medium" position; in summer it is occasionally possible to switch on to "low." As a rule the tank is switched on about 10.30 p.m. and off at 7.30 a.m.—which partly accounts for the "hot-water" load curve being higher than the night load curve in fig. 4. Under the above conditions, the temperature of the water on switching off is usually in the neighbourhood of 140 deg. F., seldom as low as 120 deg. F., or higher than 160 deg. F. In addition to the house service throughout the day, there is sufficient water for two hot baths per day. The tank is placed in the bathroom, so that any heat loss is useful in warming this room; as a result it is seldom necessary to close the window or use a fire. To heat the water to, say, 180 deg. F., and install a smaller tank would be feasible and cheapen the first cost, but the losses from the tank and the pipes are much less at the lower temperature. Experience shows that it is more economical to supply water to the kitchen at the lower than at the higher temperature. Moreover, the possibility of working at the higher temperature in case of need gives the tank a good overload capacity.

Since the tank was installed no trouble whatsoever has been experienced and there has at all times been an ample supply of hot water—equal to some 12 to 15 gallons per person per day. Without asserting that the above method is the cheapest for obtaining hot water, Table 3 will show that the cost is reasonable, and by means of a thermostat it is simple to arrange automatic heat control for such a tank. The Clyde Valley Power Co. is prepared to sell energy at ½d. per kWh for domestic water-heating during night hours; it is possible that this charge may be reduced to ⅜d. per unit. The Corporation of Greenock is offering energy for the same service at ¼d. per kWh to all classes of domestic consumers. Supply authorities might also consider the desirability of hiring out storage tanks to consumers.

Ventilation.—Fresh air is drawn into the rooms through air bricks behind the fires in the recesses, and the amount of air can be regulated in a simple manner. The outlet for the vitiated air is a wooden grid let into the frieze and communicating with the flue in the external chimney breast. This arrangement has proved to be satisfactory, and the rooms do not get stuffy when the windows are closed. To supply rooms with filtered air would entail the use of a fan, filter, and ducts and the air could, if necessary, be slightly warmed by passing it through a convector before it leaves the outlet channel. Provision has been made for the possibility of forced ventilation, but the full details have not yet been worked out, as the need has not arisen.

Heating.—The author discarded the method of living in heated air as being inferior to radiant heat for the home. The human body appreciates heat rays, whether from the sun or from a glowing fire. Moreover, radiant heat is more pleasant in a cool than in a warm atmosphere. The electric fire renders it possible to obtain radiant heat in rooms with cool air, while owing to the portability of such fires the heat can be directed just where it is needed. Naturally, after a time the air becomes heated by the warmed objects in the room, &c., but the room can be kept cool by adequate ventilation. Experience shows that with ample radiant heat an air temperature of from 50 to 55 deg. F. is very comfortable, whereas with warmed air from 62 to 65 deg. F. is desirable.

To obtain the best results from electric fires, care must be used to have the heat where it is needed. In cold weather it is much better to have two, or even three, small fires suitably distributed in a room than one large fire. No difficulty or inconvenience of any kind has been experienced. The coal fire is not missed, while the ease with which the heat can be distributed and controlled is an advantage that would not be readily sacrificed when once enjoyed. The radiator load in the home, though large, reaches its maximum in the evening, and thus occurs after the afternoon peaks during the winter; consequently the domestic heating load is not troublesome to the power station.

Running Costs.—There are many features in an all-electric house, the value of which it is hard to appraise. Tables 1, 2 and 3 set forth the consumption and cost for the 10-roomed house for one complete year. The small discrepancies between Tables 1 and 3 are to be accounted for by meter inaccuracies. The analysis in Table 3 is based on a total day consumption cost of £33 19s. 2d. divided in proportion to the day meter readings in Table 2. The curves in fig. 4 represent the weekly consumptions of these items.

Conclusions.—A true and fair comparison can scarcely be made unless corresponding costs are available for similar services obtained from coal, gas, and electricity in some combination or other. Unfortunately, not many householders keep sufficient data to check their annual expenditure. In the author's case (total cost of 16,584 kWh used in one year was £43 8s.) the all-electric house in Glasgow cost practically the same as a somewhat smaller house in Wimbledon in which coal, gas, and electricity together cost £42 and £45 in two successive years. Here, however, much less hot water was obtained. In a slightly larger house in Helensburgh, using coal and gas, the cost was somewhat higher, varying from £58 to £44. Roughly speaking, the author would say that with energy at about one penny per kWh and a low tariff for water heating there would seem to be very little difference between the cost of an all-electric house and the same house using coal, gas and electricity. Consequently, on the score of running cost, even when the manifold advantages of electricity are entirely ignored, the objection to the all-electric house herein described cannot be sustained.

Table 1.

All-electric House (10 Rooms).

Energy cost for 52 weeks (4 quarters); six persons in house, excluding guests.

	£ s. d.
Main 2-rate meter:	
Fixed charge	12 10 0
Day load—10,299 kWh, at 0.5d.	21 9 2
Night load—6,043 kWh, at 0.375d.	9 8 10
Total cost for year	43 8 0
Average cost per week	16 8
Average cost per day	2 4½
Average cost per day per person	4½
Average cost per kWh—*day consumption* ...	0.791d.
Average cost per kWh—*total consumption* ...	0.637d.

Lighting ...	568	11	1.5	0.26
Total ...	16,584	318	45	7.60

Table 3.

Analysis of Cost.

Separate meters.	Total. £ s. d.	Weekly. s. d.	Average Daily. s. d.	Per day per person. d.
Heating ...	19 3 7½	7 4½	1 0½	2
Hot water	4 0 0 (day)	5 2	9	1½
	9 8 10 (night)			
Cooking	8 18 11½	3 5	6	1
Lighting	1 16 7	8½	1	¼
Total ...	£43 8 0	16 8	2 4½	4½

Regarding load factor, the hot-water and cooking loads are practically constant throughout the year and together form some 60 per cent. of the total energy consumption. Moreover, a part of the constant load, representing 36 per cent. of the total load, is taken at night-time. It is also interesting to see how unimportant lighting becomes, both as a load and as a source of revenue, when all services are worked electrically. Thus the all-electric house in question has an aggregate consumption of about 30 times the lighting consumption, practically without increase of station plant. An example of the daily load curve is shown in fig. 5 and represents the demand on a day when room-heating was practically restricted to the evening hours.

As regards reliability, the service has not once failed. Upkeep should not be a serious item when cookers and fires can be hired and are kept in order by the supply undertaking. Minor faults causing varying degrees of annoyance occur in electrical appliances, owing to faulty design or inspection in manufacture. Probably the weakest part of the installation is the flexible cord between the plug and the appliance.

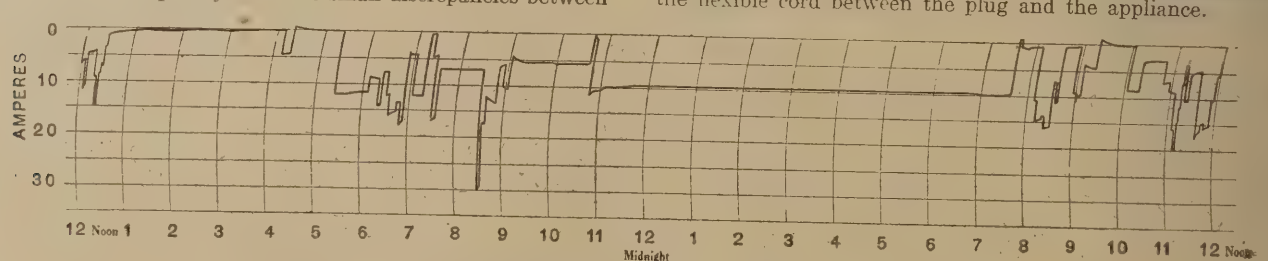

Fig. 5.—Load Curve for Monday, Aug. 25, 1925; Average Current = 6.74 Amperes.

Dalmarnock generating station uses about 1.8 lb. of coal per kWh generated. Assuming that a kWh delivered at the house needs 2.24 lb. of coal, then 1,000 kWh require one ton. Consequently, between 16 and 17 tons of coal would be needed at Dalmarnock annually to supply the services of the above all-electric house. This amount of house coal—assuming that all services could be obtained from raw coal on the premises—would cost, say, £33, while the coal used at the station would cost less than half this amount. For the coal industry it is probably better to increase the demand for station coal rather

than for house coal, while the householder will readily forgo the handling.

The drop in cooking consumption seen in fig. 4 is mainly due to the use of lighter grids. It is hoped that the present experiments will lead to further improvements in this direction. Speed and indestructibility are the ideals to aim at in the design of boiling-plates. The merits of separate utensils with built-in elements also deserve closer study. The cost of installation seems now to be receiving the sympathetic attention of supply undertakings, and the absence of coal fires in a house like the one just described may make it possible to dispense with one domestic servant and thereby not only more than repay the total cost of the electrical energy, but also lighten the domestic labour problem. Equally, the improved health of the community, by eliminating smoke, is an inestimable benefit.

Appendix.—For comparison, the following figures for a flat (three rooms and kitchen) in the west end of Glasgow are added by Mr. B. Hague, M.Sc., A.M.I.E.E. They are based on the same two-part tariff as the author's, and refer to the past year's all-electric working. The flat is at the top of the building, so that the carrying up of coal and removal of ashes presented a real problem; satisfactory ventilation can be obtained from the now unused fireplaces, combined with the judicious use of opened windows; the fires are *not* placed in the fire recesses, but are set out in the room where most required.

TABLE 4.

All-electric Flat (4 Rooms).

Energy cost for year; total consumption, 4,656 kWh.	
Cost of energy at ½d. per kWh	2,328d.
Fixed charge of £5.2	1,248d.
	3,576d.
	£ s. d.
Total cost of energy	14 18 0
Average cost per week	5 9
Average cost per day	10
Average cost per day per person	
Average cost of energy per kWh	0.768d.

The cost of hiring the cooker and two fires was £2.

The installation provided for a household of two persons (not counting guests and occasional labour), lighting, cooking of meals, hot water for domestic services and baths, heating of rooms (inclusive of occasional heating of bathroom and bedroom) and small auxiliary services. A single meter was provided, and daily readings verify the general conclusions given in the paper, *viz.*:—(1) Lighting is a small factor; (2) cooking is a fairly steady load; (3) heating is the cause of the greatest consumption and fluctuates greatly in response to seasonal variations of temperature. The energy cost is given in Table 4.

One figure, often quoted in statistics of this nature, requires comment, namely, the cost of energy per person per day. This figure, in itself, is a misleading criterion of the working of any scheme unless it is accompanied by a statement to show what services are rendered for the price. If the present household were increased to three, in none of the services would the consumption increase in proportion to the larger number of persons. Hence the cost per head per day would fall roughly to perhaps three-quarters of the preceding figure for the same domestic facilities. Thus the cost per day is a truer criterion than the cost per day per person (which is borne out by comparison between Tables 1 and 4).

As a further comparison, it may be mentioned that a Glasgow bungalow with three persons using coal, gas, and electricity, cost £15 15s. per annum, ignoring the smaller items, such as firewood, matches, &c.

Electrical Imports of British Malaya.

BELOW are given the values during 1924 of the imports of electrical and allied material into the Straits Settlements and the Federated Malay States. No strict comparison can be made with previous years owing to an alteration in the classification. It may be stated, however, that whereas in 1923 the total value of the imports of electrical machinery was given as $1,830,000, the totals of the four last items in the following table amount to only $995,000.

	Straits Settlements.	Federated Malay States.
Wire and cable, insulated.—	$	$
Total	946,000	83,000
From United Kingdom	937,000	80,000
,, Japan	1,000	—
,, United States	6,000	3,000
Telegraph and telephone instruments and apparatus.—		
Total	160,000	124,000
From United Kingdom	142,000	124,000
,, United States	9,000	—
,, Sweden	1,000	—
Electric lamps and parts.—		
Total	144,000	12,000
From United Kingdom	62,000	4,000
,, Germany	21,000	—
,, Italy	15,000	—
,, Holland	19,000	8,000
Electric glow lamps.—	$	$
Total	13,000	600
From Holland	8,000	—
,, France	—	600
Electric arc lamps.—		
Total (mainly from U.K.) ...	6,000	—
Batteries and accumulators.—		
Total	95,000	9,000
From United Kingdom	41,000	4,000
,, Japan	9,000	—
,, United States	42,000	4,000
Electric lighting accessories and fittings.—		
Total	109,000	21,000
From United Kingdom	73,000	18,000
,, Germany	6,000	100
,, Holland	4,000	3,000
,, Japan	11,000	—
,, United States	11,000	50
Electrical goods and apparatus (not machinery) not elsewhere mentioned.—		
Total	510,000	48,000
From United Kingdom	397,000	45,000
,, Italy	32,000	1,000
,, Sweden	12,000	—
,, Japan	13,000	—
,, United States	32,000	2,000
Electric generators.—		
Total	79,000	23,000
From United Kingdom	63,000	23,000
,, France	4,000	—
,, United States	7,000	—
Motors.—		
Total	533,000	33,000
From United Kingdom	246,000	29,000
,, France	17,000	—
,, Germany	22,000	—
,, Holland	9,000	—
,, United States	234,000	4,000
Ignition magnetos.—		
Total	36,000	4,000
From United Kingdom	6,000	500
,, France	5,000	—
,, Germany	17,000	—
,, Italy	4,000	—
,, United States	3,000	3,000
Other electrical machinery.—		
Total	249,000	38,000
From United Kingdom	224,000	37,000
,, Belgium	3,000	—
,, France	4,000	1,000
,, Italy	3,000	—
,, Holland	4,000	—
,, United States	2,000	—

Indian Electrical Imports.

(From Our Indian Correspondent.)

THE total imports into India of electrical machinery, instruments and apparatus during the six months from April to September of 1925 amounted in value to Rs. 209 lakhs as against Rs. 188 lakhs in the corresponding period of last year. Out of this, machinery was responsible for Rs. 96 lakhs as against Rs. 98 lakhs in 1924, and instruments and apparatus were valued at Rs. 113 lakhs as against 89 lakhs. There would therefore appears to have been a slight decline in the case of machinery and a satisfactory increase in the case of instruments and apparatus. Quantitatively there does not appear to have been any decline in machinery imports as prices were rather lower during the period. The imports of the various classes of electrical machinery were as follows:—

	1924. April-Sept. Rs. lakhs.	1925. April-Sept. Rs. lakhs.
Control or switchgear	16½	18½
Generators, dynamos, &c.	17	16
Motors	20	17
Transformers	5½	6¾
Turbo-generating sets	2	3¾
Other machinery	37	34

Out of the Rs. 96 lakhs worth of machinery, the United Kingdom's share was Rs. 76 lakhs. This was a considerable decline from the corresponding period of 1924, when the imports from the United Kingdom amounted to Rs. 85 lakhs. Imports from Germany increased from Rs. 2 lakhs to Rs. 5½ lakhs and those from the United States of America from 6 lakhs to 7½ lakhs. The latter country is now making considerable effort to regain the position which she lost during the previous year. Imports from the United States during April to September, 1923, amounted to Rs. 18½ lakhs.

As regards the imports of electrical instruments and apparatus, as already mentioned, there was a satisfactory increase.

The imports of electric fans increased from 12 lakhs to 14 lakhs, wires and cables from 34 to 37½ lakhs, electric lamps from 8½ lakhs to 14 lakhs, accumulators from 4½ lakhs to 5½ lakhs, electric lighting accessories from 8 lakhs to 8½ lakhs, meters from 3 to 3½ lakhs, and batteries from 4 to 5 lakhs. On the other hand, there were slight decreases in switchboards, carbons and unenumerated goods.

In this trade, the United Kingdom increased her share during the period, to 73½ lakhs as against 60½ lakhs in April-September, 1924. Though this appears to be a satisfactory increase it has to be remembered that in the corresponding period of 1923 the imports amounted to 92 lakhs. Other countries also increased their shares, Germany from 11 to 12 lakhs, the Netherlands from 3½ to 5½ lakhs, Italy from 2½ to 3½ lakhs, and the United States from 9 to 12 lakhs.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

There are now on the market several types of apparatus which, it is claimed, enables any make of radio-telephone receiving apparatus to be operated from the domestic electricity supply mains, the set being switched on and off very much like a lamp or radiator. The idea is to provide a device that will enable the user to dispense with batteries and accumulators and, at the same time, minimise the generator hum which is frequently heard when operating off the town's supply mains.

The "Chargeless Supplier."

An outfit of the above-mentioned kind is marketed by MESSRS. ATTAIX, LTD.; for a.c. service it consists of a perforated-metal box on top of which is a tumbler switch and three pairs of leads: two of them are used to furnish the h.p. and l.p. currents to the receiver, whilst the third is plugged into a lampholder or wall plug; the special cover of the combined plug-adaptor protects the user against shock and short-circuit. Two rectifying valves are locked in the box, so that access to them cannot be gained unnecessarily, but no rheostat is needed as the box also contains a special resistance lamp that automatically takes any excess load, and also any increase in the voltage of the mains

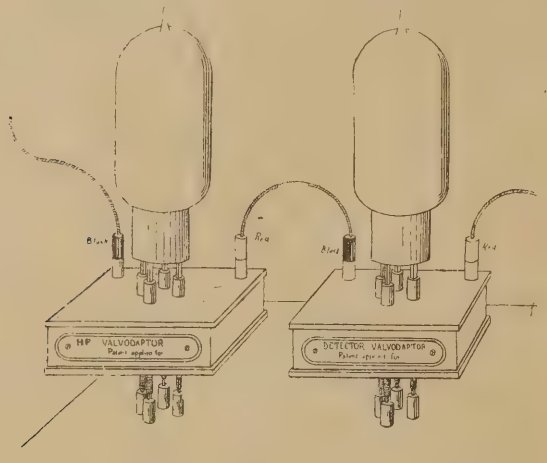

Fig. 1.—"Valvodaptors."

up to 30 per cent., so that the rectifier is operated simply by the above-mentioned tumbler switch, and suffices for from one to six valves. It should, however, be noted that only dull-emitter 0.60-A valves should be used. The h.p. current is delivered at from 70 to 90 volts and the l.p. is between 3.5 and 4 V. When operating off a.c. supply mains "valvodaptors," illustrated in fig. 1, are essential in most cases; they are made to fit the valve holders of any make of receiver set and in three patterns according to position, namely, h.f., detector, and l.f., their function being to connect all the valves in series. The d.c. "chargeless" outfit is similar, but of course no rectifiers or valvodaptors are necessary and a rheostat is used instead of the regulating lamp; the negatives of the h.p. and l.p. should not be coupled. The makers guarantee freedom from generator noises on both a.c. and d.c. circuits at all frequencies between 25 and 100 cycles per second.

"Clix" Twin Plug and Ringtags.

The latest additions to the varied range of accessories produced by MESSRS. AUTOVEYORS, LTD., are twin plugs which can be effectively employed for battery connections, multiphone applications, and wherever the possibility of a short circuit being made by the contact of two independent plugs necessitates dual connections. Ringtags are useful terminators for stranded wire, and particularly so for employment with "Clix." The difficulty experienced by some people in manipulating hollow radio conduit with ordinary pliers has precluded their full use of it for interconnecting components of receiving apparatus, but it should be noted that trouble of this nature can be overcome by the use of round-nosed pliers, which assist the conduit to bend into most shapes.

Another Pendant Loud-speaker.

An improvement on the hanging loud-speaker recently illustrated in these columns is the "Mellovox Pendant" shown in

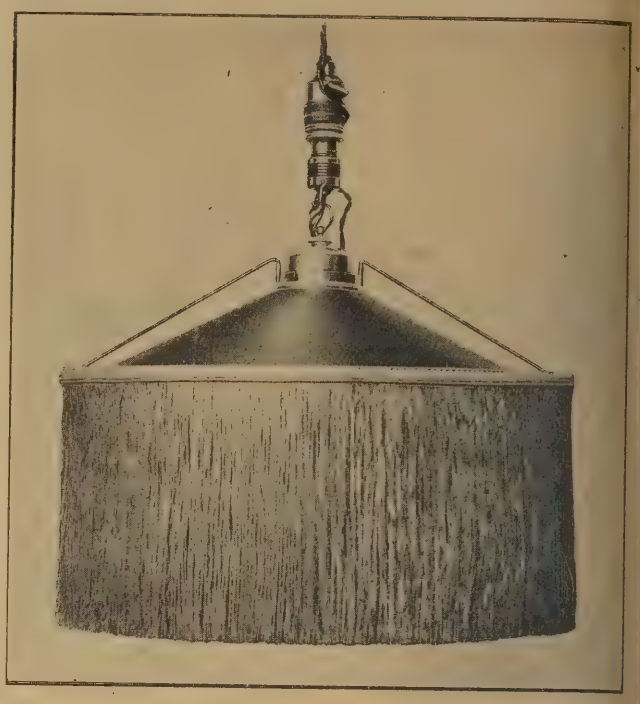

Fig. 2.—New "Mellovox" Pendant Loud-Speaker.

fig. 2, a product of the MARCONIPHONE CO., LTD. This accessory fulfils the functions, not only of a loud speaker, but also of an electric lampholder and shade, and is equipped with a plug which enables one to plug direct into the existing lampholder which is usually suspended from the ceiling. In this method of suspension trailing wires about the floor and tables are eliminated and the artistic shade adds to the decorative effect of the drawing-room.

New "Claritone" Loud-speakers.

Broadcasting having reached that stage at which receiving apparatus is commonplace in most homes, there has arisen a demand for modified forms of construction and styles of finish which will harmonise with the appointments of the rooms in

Figs. 3 and 4.—Plaque and Statuette "Claritone" Loud Speakers.

which receiving sets are commonly used, but the improvision of an attractive and unobtrusive loud speaker is not easy, for by virtue of the fundamental laws of acoustics it is essential that some of the dimensions of sound amplifiers must be fairly large. Enclosing the conventional model in a cabinet and concealing the presence of the horn by a fretted sound-aperture panel in the front is common practice; it, however, entails a larger and more costly cabinet than would otherwise be necessary. Accordingly, two new designs of speaker have been introduced by the Automatic Telephone

Manufacturing Co., Ltd., which differ considerably in external appearance from the two familiar "Claritone" models with the conventional "swan-neck" horn. In one of the new models, fig. 3, the horn has been eliminated and replaced by two bowls, between which there are amplifying passages which function in a similar fashion to an ordinary trumpet. This form of construction lends itself to a much more compact and flattened exterior, resembling an ornamental plaque, which can be hung from a picture rail or strong hook against any convenient wall. Suitably strengthened conductors serve as cords for this purpose and lead to terminals mounted on a moulded insulating medallion which also carries a suspension eyelet; by running the connecting leads in the groove of the picture rail, all trace of wires can be concealed. The statuette model, fig. 4, provides graceful supports for the receiver, sound passages being arranged within the central portion, which provides the length necessary for correct reproduction. In both these new "Claritone" models the original receiver mechanism is retained, together with the lever adjustment for varying the air gap between the diaphragm and magnet poles. The wholesale distributing firm is the Ashley Wireless Telephone Co.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Salaries of Combustion Engineers.

Your "Shift Engineer" correspondent can rest assured that in the majority of cases there is no belittlement of his status, by raising that of the combustion engineer, for the simple reason that in a considerable number of instances the wireman-cum-switchboard attendant-cum-shift engineer procedure holds good. This being so, it is not surprising that we are confronted with the pertinent query: whence cometh that practical knowledge of boiler-house thermal efficiency in detail, so essential to fuel economy, to justify senior rank being given to the shift charge of the type referred to? The fact remains that the creation of the position of combustion engineer was due to the inefficiency of the majority of shift engineers in matters concerning the efficiency of heat liberation and transfer and not to their inability to devote the necessary time to the efficiency of steam production, as suggested.

The logical deduction is that the man whose training enables him to get an easy grasp of the fundamentals coupled with the study of the main essentials to economical power production should, to say the least, have a higher rating and remuneration than the man who, by virtue of his training and consummate lethargy, tends to become nothing more or less than a rule-of-thumb operator.

W. D. W.

December 10th, 1925.

Regarding "Shift Engineer's" letter on the above subject, I am afraid he has a great deal to learn. It makes one smile when he says that in his opinion every shift engineer worthy of the name is a combustion engineer. Far from it! as is shown by the wretched thermal efficiencies of the power stations of England for the last 12 years, averaging not more than 12 per cent.; boiler-house efficiency about 65 per cent. Combustion is a science, and it needs a specialist to deal with it, not a shift engineer who knows, in most cases, a lot about everything but is master of nothing. Who is "Shift Engineer," by the way, who goes beyond his superior officer who engages the combustion engineer, when he says a combustion engineer is only necessary because he himself has not time to attend to the boiler house? Yet he signs the coal sheet, when he acknowledges he hasn't time to devote himself to the boiler house.

The combustion engineer is not paid as much as the shift engineer for the very reason that England at present is behind the times. The boiler house is still to a large extent looked upon as a necessary evil which one must have but which it is best to ignore, and that is only because we have not yet looked upon combustion as a highly technical science. We are only just beginning to learn that a great saving can be made by burning our coal efficiently. An enormous saving can be and will be made in the production of steam in the future, provided that a specialist is obtained to control the burning of our coal, a specialist on each shift, who will have sole command in the boiler house and be responsible for it during his shift, as in America. I can see that in the future a shift engineer will be in control of the turbine room and control room and his responsibility will cease at the turbine stop valve; from there the combustion engineer will be in command, and the latter will be paid a higher salary for the very reason that it is in his hands to effect an enormous saving due to his being a specialist in efficient combustion. The position of combustion engineers is a fairly new one and so naturally we are placed under the shift engineer; it is because of this that the efficiency of a boiler house has not yet attained the high degree it ought to have done. When the chief engineers place more confidence in us and allow us to run the boiler house under our orders, the efficiency will go up.

A Combustion Engineer.

December 8th, 1925.

Rural Electricity Supply.

I think your readers will agree that, prior to Mr. F. W. Purse's intervention, Mr. S. C. Bartholomew and I were proceeding with our discussion—giving and taking hard blows with mutual good temper—and I understand we were followed by many readers with interest and enjoyment. In the process much useful information was divulged on both sides, and we are all now waiting for the figures which Mr. Bartholomew really ought to produce to justify the refusal to put the Northwich-Middlewich and Winsford local line underground, which caused the Middlewich monstrosity. I submit that, in default of clear proof that no cheaper method was possible, I am entitled to a verdict to the effect that the Post Office proceeds by rule rather than by reason, whereas there is an urgent necessity in the public interest that reason must come before rules. As a subsidy is under official consideration for rural supplies, the public has not only an ultimate interest in seeing that a State monopoly does not hinder other equally important services, but also, as taxpayers, in seeing that the habit of making a fetish of rules does not cause unnecessary expense.

Those undertaking rural distribution will frequently meet with Post Office lines in the areas between towns and in every village street. An attitude like that taken up by the Post Office in the discussions set out in the report of the Electricity Commissioners is a confirmation of the correctness of the remarks I have made as to the self-centred attitude hitherto characteristic of the Post Office. I believe the Government which controls the Post Office, and which also wants rural electricity supply, will help us to secure the active co-operation of the Post Office in giving our service to the rural dweller, even if it involves the sacrilege of recasting some of its rules. We must not omit to let the Government know the real position.

With Post Office reform, coupled with some slight modifications in the regulations and permission to use earth as a return on conditions similar to those for tramways and railways—surely a very modest request—overhead lines can be constructed at sufficiently low cost to avoid any rural development subsidy, except in special cases. We also have to get rid of the delay of from three to six months in obtaining permission to use overhead instead of underground mains, even in areas where nothing but overhead mains would be encouraged by the Commissioners. We shall then be ready to deal with rural areas on a practical basis.

I gather from Mr Purse's questions in his last letter, which answer themselves, that he had not intended to advocate the compulsory application of the 1924 edition of the I.E.E. Rules; that he does not approve of the policy of subsidy, and that he intended his reference to Ontario giving a 50 per cent. subsidy to be a warning and not an example. He now offers to assist me in forwarding rural development, if I will refrain from abuse. I can gladly accept his offer because I have never abused an opponent. I have exposed official inertia, but have stated that Post Office engineers are helpless in the face of the rules and the Post Office system; I have criticised rules, not rulers. Looking back over the correspondence, I find that my opponents have not been so careful to spare the man. I have been called a Don Quixote—that lunatic embodiment of the spirit of chivalry. I have been called the reciprocal of a big man, and worst abuse of all, have been classed by Mr. Purse with *astute* lawyers. This last insult could not be borne by an engineer, so I "lashed out." As Mr. Purse's complaint was based upon a misunderstanding of this apparently small, but really important, difference between man and matter, I am sure he will withdraw his original slighting remarks as I gladly withdraw my replies, which were intended to be caustic but not "sneering."

The ELECTRICAL REVIEW'S decisive part in this movement deserves widespread recognition. The Editors also have been most generous in the allocation of valuable space.

W. Fennell.

Northwich, *December 10th*, 1925.

I have been particularly interested in the correspondence passing through your columns on this undoubtedly important subject.

There is no doubt that we in this country are seriously handicapped by regulations, and your issue of November 20th, containing Mr. R. Borlase Matthews's letter, gives us something to think about.

Apart, however, from the technical side involving factors of "ignorance," I feel that the question of wayleaves is not stressed sufficiently. Figures have appeared in your columns and scant references have been made by the writers therein to this subject, but unfortunately we are not getting at the right people by writing to the technical Press.

I have spent the past sixteen months doing that thankless work—the negotiation of wayleaves—in the Midlands and I can only describe it as heartbreaking. It is undoubtedly a task for those fortunate people blessed with an unlimited amount of tact, and perhaps I have only recently found it. At any rate I have spent about nine months negotiating wayleaves for about ten miles of single-pole 11,000-volt line where some twenty-four landowners are involved. Surely there is one answer to Mr. Matthews's question as to how to reduce the cost per mile of overhead line!

Some may say that their answer would be to dismiss the writer as incompetent! Sometimes I feel so discouraged that I would make the same answer. But my point is this: that in spite of the 1919 Act and Section 22, we are still up against the farmer, but more still, that person I dread—the estate

agent. I have spent hours arguing about "poles in hedges" and "poles in fields" and "eyesores," and so on *ad inf.*, but one might as well talk to a deaf mute (with all due respect).

I will admit that our great difficulty is the matter of rental. Heavy rentals have in the past been agreed, because the supply authority had no option, I presume, and one always hears that so-and-so is getting as much as £5 a pole from the Post Office, so why shouldn't he? To talk about a "cheap and abundant" supply of electricity usually involves some retort about dividends and no amount of persuasion will impress upon the landowner that in the long run he will have to lose on the bargain by insisting on a high rental.

I would suggest that the only way of easing this point is to standardise rentals by Act of Parliament (for different kinds of land, of course). It would make my job easier, anyway, and apart from that it would reduce the ultimate cost of the proposed line. Section 22 is very useful, but the delay caused by having to use it loses revenue from a line which might have been earning money months ago, but for one or two owners sticking out for a higher rental.

I should be delighted to hear of some of the experiences and suggestions of any other "wayleave makers" who read your columns, because I feel that as yet I must have lots to learn!

There are only two remedies in my mind at present. The first one (which I will confess is not original) is to serve every farmer in the country with a copy of Section 22! The second is to advertise the trouble in the daily Press. (Incidentally, a protest of mine on these lines was returned "with the editor's regrets.") I notice that admirable body, the E.D.A., is giving us a hint about electricity in the home most days and wonder if this question could be taken up by it?

W. W. Clarke, B.Sc. (Eng.).

Ilkeston, *December 8th*, 1925.

Chemical and Combustion Engineering.

I sincerely hope that the scheme for making Finsbury Technical College a centre for teaching chemical engineering will succeed, and I suggest that the systematic teaching of *combustion engineering* be located there also.

Chemical and combustion engineering are very much akin, because combustion engineers and fuel technologists must necessarily have considerable knowledge of organic and inorganic chemistry. Objection may be raised that the Finsbury building is unsuitable for boiler testing, &c., but no doubt arrangements could be made at a near-by power station to run occasional boiler trials.

If the above suggestion were to be carried out, Finsbury College might also become the headquarters of the Institute of Chemical Engineers, and also of a new Society of Fuel Technologists or Combustion Engineers, which is badly wanted, because of the greater advances now being made.

It is becoming the fashion to locate scientific and engineering societies in colleges, *e.g.*, the present address of the American Electro-Chemical Society is at the Columbia University, New York City, and at one time it was at Lehigh University.

Another suggestion I make is that a scholarship for combustion engineering be founded to perpetuate the name of Bettington, a principal pioneer of pulverised fuel firing, who lost his life as an aviator in the war.

E. Kilburn Scott, A.M.Inst.C.E., M.I.E.E.

London, *December 11th*, 1925.

The Metering of Three-Phase Power.

Mr. Jaques will no doubt agree that if the sum of the three voltages between each phase and star point is zero, a two-element 3-phase, 4-wire meter will register a 4-wire load, however unbalanced, quite as accurately as a two-element meter will register a 3-phase, 3-wire load, however unbalanced it may be provided always that the sum of the three line currents is zero.

The above condition could not have been complied with in the steel works referred to, and if the supply was given along a length of low-pressure cable, having a fair voltage drop, the unbalanced nature of the load would prevent the condition $e1 + e2 + e3 = 0$ being complied with. What I wish to emphasise is that the error was due to the delivered voltage and not due to the nature of the load. I give some figures below for a steelworks load consisting of induction motors and single-phase welders connected across phases. The supply is given direct from a delta-star step-down transformer installed in the works, and is metered on the l.p. side by means of a two-element 3-phase, 4-wire meter in series with three single-phase meters. The voltage $e1 + e2 + e3 = 0$, provided the sum of the voltages between each of the three pairs of h.p. lines is zero (which must be so as the supply is three-wire) and provided that the power transformer has the same ratio on each of the three limbs at all the conditions of load metered. My experience leads me to consider the latter to be the case within reasonably small limits.

The following are the figures, which show the two-element meter to be accurate:—

Three-phase meter	100%	of units consumed	
Single-phase meter on phase A ...	32.4%	,,	,,
,, ,, ,, B ...	14.3%	,,	,,
,, ,, ,, C ...	53.0%	,,	,,
Total of single-phase meters ...	99.7%	,,	,,

In the third paragraph of his letter, Mr. Jaques misquotes me when he says I agree that three separate metering elements are desirable for the correct metering of a three-phase, four-wire supply. I said three separate meters, and I do not agree that it matters not whether they are in the same case or not. Although I have in the past made tests which show that there is more interaction in a three-element than in a two-element meter of the same make (and I have yet to discover the meter without interaction) I have not the figures at hand, but I shall have the results of some tests available shortly and will communicate them.

The statement of Mr. Jaques that I was anxious to see supported by facts and figures if possible was his statement that he had often seen inaccurate metering systems operating against the consumer. What proportion of power consumers does he estimate are being overcharged?

A Meter Superintendent.

December 14th, 1925.

The Salaries of Assistant Engineers.

It would appear to me that some of your advertisers who invite applications for appointments as "Assistant Engineers" feel very optimistic towards filling their vacancies satisfactorily.

It seems hardly credible that an efficient and responsible man possessing all the qualifications stipulated (namely, good technical education, workshop training, sound central-station experience, together with knowledge of internal-combustion engines and, perhaps, steam engines and boiler-house experience) could be found for the wages offered, unless the applicant had a private income (which, of course, is not usual amongst young electrical engineers).

However small a power station is, provided it is worthy of that name, the engineer, who is responsible for all matters affecting the efficient running and maintenance of the plant, is worth more than a bare living wage!

I feel sure that some of your readers will agree with me that I am justified in stating that the present-day assistant engineer, that is, the man who does the hard work and gets told off whether he is at fault or not, is greatly underrated in sterling worth.

F. C. Zula-Crosse, B.Sc.

Hollinwood, *December 10th*, 1925.

Cutting Girders Under Water.

We should be much obliged if any of your readers could give us information regarding the sub-aqueous cutting of girders, &c., by the electric arc, and if possible tell us the names of any manufacturers of the necessary plant.

Arc.

December 9th, 1925.

The All-Electric House.

I have been much interested in reading the first instalment, which you have published, of Dr. Parker Smith's interesting paper, and your comments thereon.

In view of your regret at the curtailment of the debate, I trust you will be able to spare space in your columns for a discussion by correspondence.

Dr. Parker Smith is to be congratulated on his pluck in building such a house, in face of discouragement, which I daresay was not confined to one sex. I would wager that he had to overcome intuition as well as reason.

The results must be considered very satisfactory. If any man or woman doubts the advantages of the all-electric house, I would recommend him or her to undertake, personally, the cleaning, relaying, and lighting of, say, three open fires one morning; and not to neglect to sift and save all cinders above one-eighth of an inch in size. Afterwards he, or she, should take a damp duster and go carefully over the whole exterior surface of every article in the three rooms to remove the resultant soot and ash.

When labour and dirt are reckoned, the all-electric house wins easily.

Next to the all-electric, I would rank a combination of gas and electricity far above a combination of electricity and coal fires.

The heating of water has hitherto been regarded as the great stumbling block; but Dr. Parker Smith has got over this by his immersion heaters. It would be interesting to know whether his tanks and pipes are thoroughly lagged.

Dr. de Ferranti's point that refuse disposal must be provided for is important. In Glasgow they are now building the biggest combined destructor and electric generating plant yet undertaken, and everyone's refuse will be collected, transported (a long way) to this station, and there turned into electricity, for power and light, and clinker for clinker-bitumen road surfaces.

In places where refuse collection is not carried out, small incinerators for home and garden refuse and rubbish can be easily obtained for each house, or group of houses, and they convert the refuse into a valuable fertilising ash.

It is a reproach to successive Governments that electricity is still in a vicious circle. Until it is cheap it will not be generally used, and until it is generally used it will not be cheap. Glasgow has broken the circle for herself, and made possible Dr. Parker Smith's ideal home.

G. Watson.

London, *December 12th*, 1925.

The Contractor and Assisted Wiring.

The discussion excited by the almost sensational success of the first experiments in this direction has elicited various contributions from the wiring contractor's side. These range from a frank recognition of the facts (which does him credit) by Mr. L. G. Tate, through the political misgivings of Mr. R. E. Robson, to the engaging candour of Mr. Howard Smith, who "sees nothing in these assisted wiring schemes"—for the contractor.

It is perhaps only human nature that the contractor should be painfully struck by the "nothingness" of a development which renders it apparent that he is no essential link in the electrical chain. The hard fact is, however, that the producing and consuming sides of the industry care nothing for the weal or woe of the electrical contractor as such, and will certainly not see their long overdue *rapprochement* impeded by any consideration of providing him with an easy living, if he cannot make it to their advantage to do so. Thus if, to quote Mr. Howard Smith, the contractor does not fancy touting for orders for three-light installations and other small beer, he will be politely ignored while these contemptible little installations, *in their millions*, are put in by someone else. After all, where is the installation contractor in the great gas industry? It exists, in a very lively state of health, without him.

Then consider the wickedness of the supply authority which purchases material direct from the manufacturer, instead of allowing the honest factor to draw a percentage on the price for passing orders through his books. He does not even need to touch the material, which, owing to the quantity, the manufacturer will doubtless deliver direct to the supply authority. He is not giving extended credit; he is not here assuming any risk of bad debts. What then is the service he can render? The plain fact is that if any middleman *can* be dispensed with he *should* be dispensed with.

With regard to the Socialistic developments which Mr. Robson fears, if the contractor is an efficient, enterprising, and useful member of the industry he can doubtless show the supply authority that it will be a saving to entrust the work to him. If it still persists in doing the job itself at greater cost, it has the ratepayers to reckon with. Mr. Robson says: "It is admitted that private enterprise is responsible for the advancement of any industry, and that wherever the State has undertaken a commercial venture it has been unsuccessful." But Mr. Robson would surely not contend that all municipal commercial ventures have been unsuccessful? Mr. Edgar, whose enterprise he commends, is himself a municipal official. Public control of public utilities, although a form of Socialism, is not nowadays considered to need any defence.

It is quite certain that without assisted wiring in some form or other the penetration of electricity into the great mass of small homes will never take place. Will the wiring contractor clutch at the broom of Mrs. Partington, or endeavour to adjust himself to the inevitable?

A Manufacturer's Salesman.

December 11th, 1925.

Overhead Distribution.

As the engineer responsible to the B.D.S. Co., Ltd., for the distribution scheme in Brundall, I am interested in Mr. Glendenning's remarks. Having "had a look at the village," he is of course quite entitled to express his keen disapproval of the system adopted.

The financial point of view can always be ignored by those who have no financial interest in a scheme of the kind, but I am afraid that the financial question is of the most important consideration if rural distribution is to be encouraged, and to be of real service to the country.

Taking the Brundall proposition as an example, the company is actually supplying current to about 75 per cent. of the inhabited houses in the village, and as I trust (living in Brundall) that most of the occupiers are of a "good class of people," it would seem that Mr. Glendenning's sympathy is misplaced, as obviously anyone who entirely disapproved of the company's scheme would refuse to become a consumer.

Another point: A number of residents faced with the domestic servant problem, find their worries very considerably reduced by the aid of a very cheap supply of electricity for cooking, heating, cleaning, &c.

I am quite sure, if purely for æsthetic reasons underground mains with their relatively expensive services to consumers' houses had been laid, the company's charges for electricity would have been at least double the present rate, and in this event a large number of the existing consumers would have been prohibited from obtaining the benefits now available.

Any frontage owner could have had the mains laid underground past his property by paying the difference; up to the present, only one such owner has decided to adopt this arrangement, with, in my opinion, every good reason for so doing.

It should also be noticed that where a compulsory crossing of the road has occurred, through the company's inability to obtain wayleave, heavy guarding has been at once involved, and this is probably the principal cause of Mr. Glendenning's complaint.

If rural distribution is to be a commercial proposition, the capital cost must be kept within certain limits, and while telephone and telegraph poles are tolerated, often on both sides of the road, I fail to see why the same concession should not be granted, from a utility point of view, for electric power poles.

I think the whole question can be summed up in the statement that overhead lines properly run are no more unsightly than existing poles for telephones, wireless, &c., and that rural districts prohibiting such a system will have to wait a very considerable period before any commercial company will undertake the very great risk of giving a supply with an abnormal first cost for cables and services.

It is, I believe, a matter of cheap electricity or none at all in many rural areas, and I am quite sure the Brundall consumers would vote solidly for a supply of electricity with the poles, in preference to no supply at all.

G. Redgment.

Norwich, *December 12th*, 1925.

Discussions at the Institution of Electrical Engineers.

I am glad to know that some attention is being given to the question of the hour at which I.E.E. meetings end, and I hope that this attention will be extended to the question of the hour at which they begin.

During the war, when restrictions were many, and travelling was difficult, to say nothing of the dangers from the air that attended upon being out too late, the custom grew up of holding the meetings at 6 o'clock; but nowadays there is no reason why, if members wish, they should not be held later. I am aware that a vote was taken on the subject some time ago, and presumably a majority was obtained for continuing the present practice, but I suggest that this is not a matter which should be decided by the greater convenience of the greatest number, but by the average convenience of all. No doubt gentlemen whose business operations are carried on within reasonable reach of the Embankment like to get to the Institution by about 5.45, have a cup of tea, attend the meeting and get home by about 8.30, but I do not know whether it is realised that some of us whose business operations are carried on a little way out of London can never by any chance get to a meeting at 6 o'clock without making special arrangements, which are often very inconvenient and difficult to make. If the informal meetings can be held at 7 o'clock, why cannot the ordinary general meetings? Personally, I should prefer them at 8 as in the old days, but I would be willing to compromise on 7, and it would at least enable me to put in an appearance at meetings, which I can never do now.

A. J. Cridge.

London, *December 12th*, 1925.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

Wireless Telegraphists' Wages.—On December 7th, Sir A. STEEL-MAITLAND, the Minister of Labour, informed Mr. Lansbury that the rates of salary of wireless telegraphists as agreed upon between the London and District Association of Engineering Employers (on behalf of the Marconi International Marine Communication Co., Ltd., and Siemens Bros. and Co., Ltd.) and the Association of Wireless and Cable Telegraphists, before December 1st were £8 17s. 6d. per month in the first year of service, rising by annual increments to £20 in the ninth year. The reduction as from December 1st, of which notice was given, was 22s. 6d. per month. The agreement contained no reference to the actual hours of duty, but provided that the telegraphist should give his whole time and attention to the discharge of his duties.

Ships Without Wireless Operators.—On December 7th, Sir P. CUNLIFFE-LISTER, President of the Board of Trade, informed Mr. Lansbury that returns from the principal ports showed that up to Friday evening, December 4th, 25 passenger ships and 124 cargo ships had sailed without wireless operators.

On December 9th Sir B. CHADWICK informed Mr. Kennedy that according to the returns from the principal ports, the number of ships coming under the provisions of the Merchant Shipping (Wireless Telegraphy) Act, 1919, which had proceeded to sea with operators holding only restricted certificates up to the end of the previous week was 9; the number which had at least one operator, but not the number required by the rules, was 13; while 178 ships had no operators at all.

Census of Production.—On December 7th, Sir P. CUNLIFFE-LISTER, President of the Board of Trade, informed Mr. R. Wilson that the forms on which the returns for the Census of Production in 1924 were to be made were issued some months ago to those from whom returns were required. About 60 per cent. of those forms had been received back, with more or less complete particulars shown on them. Reminders were being sent to firms who had not returned the forms, asking that the particulars might be furnished immediately. Until a large part of the outstanding returns had been secured, he would not be in a position to state when the summarised results for the principal industries were likely to be available for publication, and regretted very much that so much delay should occur in securing this very valuable information, and he appealed to all firms in default to respond at once to these requests for information.

Lead Poisoning.—On December 10th, Mr. ROBINSON asked the Home Secretary how many cases of lead poisoning occurred among pasters engaged in the manufacture or repair of electric accumulators in the years 1921, 1922, 1923, and 1924.

respectively; and whether any cases had been reported since the new code of regulations came into force on March 1st, 1925.

Sir W. JOYNSON-HICKS said that there were five such cases reported in 1921, 11 in 1922, 44 in 1923, and 42 in 1924. Since March 1st last there had only been 15 cases among pasters. The new regulations could not be expected to have their full effect for a considerable time, but they appeared to have already caused a substantial reduction in the number of cases.

Engineering Exports.—On December 10th, in reply to Captain A. Evans, who asked what was the average value of engineering exports in 1925, Sir B. CHADWICK, Parliamentary Secretary to the Board of Trade, said that the average values per ton of exports, from the countries named, of all descriptions of machinery, including electrical machinery and locomotives and tractors, during the first nine or ten months of 1925, were as follow:—United Kingdom (10 months), £95 per ton; Belgium, including Luxemburg (9 months), £41; Germany (9 months), £82; France (10 months), £53.

Bedfordshire, Cambridgeshire and Huntingdonshire Electric Power Bill.—This Bill came before an Unopposed Committee of the House of Commons on December 10th. Mr. SEAGAR BERRY, for the promoters, said that the Bill had been an early one, and in the ordinary course of events would have passed through Parliament by about July last, as it was unopposed throughout. When the Bill was before the House of Lords it contained a proposal to erect a power station near St. Neots, but at that time Lord Weir's Committee was appointed by the Government to deal with the whole position of the electricity supply industry, and the Ministry of Transport told the promoters that it would be inconvenient for the Bill to be proceeded with at that stage. Consequently, the Bill was taken out of the group into which it had been placed for consideration by the House of Commons and put back. Subsequently the Ministry of Transport informed the promoters that there would be no objection to the Bill's proceeding on the understanding that the proposal to build a power station was taken out and that there was inserted in the Bill a clause providing for the purchase of the undertaking in 50 years' time by a Joint Electricity Authority, if such an authority should be set up. The mains of the North Metropolitan Electric Power Supply Co. practically touched the boundary of the area scheduled in the present Bill, and that company was prepared to give the promoters of the scheme a sufficient supply of electricity to carry them on for some years, at any rate, until it was known what would be the effect of the Weir report. In addition, the promoters of the scheme were in negotiation with the Peterborough Corporation, and there might be a possibility also of obtaining supplies from Cambridge.

Sir JAMES DEVONSHIRE, who is one of the promoters of the present scheme, as well as managing director of the North Metropolitan Co., formally proved the preamble of the Bill, and the Committee ordered it to be reported for third reading.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from December 9th. In the case of foreign applications, the names and addresses of the British representatives are also given.

(ZF4. No. 455,757. Class 6. Magnetos.—Robert Bosch Gesellschaft, Militarstrasse, Stuttgart. (W. P. Thompson & Co., 12, Church Street, Liverpool.)

Strowger. No. 455,491. Class 8. Apparatus for use in automatic and semi-automatic telephony.—The Automatic Telephone Manufacturing Co., Ltd.

Neutrola. No. 461,183; Neutrola-Grand. No. 461,184; and Neutrolette. No. 461,185. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy.—The Fada Radio Co., Ltd. Alexandra House, Kingsway, W.C.

Tensilite. No. 462,776. Class 8. Electric cables.—Callender's Cable and Construction Co., Ltd.

BB Ring Battery (lettering and design). No. 462,557. Class 8. Electric batteries.—G. Bowerman, 10-12, Ludgate Hill, E.C.4.

Goodwinex. No. 463,039. Class 8. Electrical instruments and apparatus.—J. Dyson, 5-7, Godwin Street, Bradford.

Gallaphos. No. 463,487. Class 8. Electric batteries and accumulators.—Batterien und Elemente Fabrik, System Zeiler Gesellschaft, 20, Rungerstrasse, Berlin. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.)

Apex (lettering and design). No. 449,549. Class 13. Electric switch- and fuse-gear.—Foster Engineering Co., Ltd.

Insuloid. No. 459,079. Class 50. Electric switch covers, switch plates, electric insulators, and insulating preparations and materials.—J. A. Crabtree & Co., Ltd.

Water Power Resources.—In a paper on "The Development of Water Power Resources" read before the Liverpool Engineering Society, Mr. A. E. Malpas analysed the findings of the Water Power Resources Committee, which were published by the Board of Trade in 1921. He reviewed separately the water available and developed in each country of the British Isles, and also Norway. In dealing with Ireland he gave considerable attention to the Shannon Scheme. With regard to Scotland he said steps had been taken under the Lochaber Power Act to extend the activities of the British Aluminium Co., Ltd. The new extension would bring the installed capacity of the plant up to 107,000 e.h.p. The aggregate amounts of undeveloped water power in the countries of Great Britain in 1921, said the author, were: Scotland, 194,965 kW; Wales, 35,900 kW; and England, 20,440 kW.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

On Efficiency.

MUCH is written nowadays about efficiency. As a slogan it is hackneyed; it is a phrase which has been worn almost threadbare. At the same time, however, there was probably never greater need for real efficiency than there is to-day.

Unfortunately, many of those to whom the idea should mean most, seem in effect to regard it mainly as a debating point. They pay lip service to a doctrine, but fail to realise that it involves definite and serious practical application. Almost all concerned affect a belief in efficiency, but here, as often elsewhere, creed and deed may be sundered far. Too many who recognise the need for efficiency, in point of fact consider it as a matter affecting the other fellow.

The management is all too prone to consider that it is only the executive which is to blame for any clogging of the wheels. The executive, oftener than not, alleges outworn methods, and obsolescent, if not obsolete, machinery as the cause. Each is probably right—in part—and as wrong as right. Certainly the management which fails to realise its own responsibility in this matter is heading straight for the rapids. Rebuffs await such a policy—these, and a relegation to the category "has been." The management should realise that it has its own end of the burden to lift. That end, too, is the big end. There must be thorough and periodical overhauling of tools, processes, methods, and programmes. This is no fancy, luxury stunt: it is bed-rock, bone-deep necessity. There is the most urgent need for a far view, a near view, and a keen view. It is imperative to keep in the van of progress so as to compete unimpeded by gratuitous handicap. All this involves constant all-there-ness, most assiduous study, and wisely conceived, well-organised application. Where pains are taken in these particulars, there is of necessity careful planning beforehand as to ways and means. Programmes, however, devised on such lines are never haphazard. They are calculated, well-balanced enterprises, and, given a fair trial, have in them the seeds of success.

Now it is up to the management most of all to devise suitable programmes, to provide the machinery, to discover the ways and supply the means. This involves serious thought, a thorough grasp of the needs of the case, an adequate understanding of the various methods available to satisfy those needs, and the ability to appraise relative values, and to adjudge wisely among alternatives. It demands all this, and a great deal more. In fact, this is but the framework, the scaffolding. Not only must there be the system to work, that system must be worked to the very best advantage. A wise management will not only consider the system as

a thing apart, as a system pure and simple; it will consider that system in relation to the work to be done thereby, and also as related to those who are to use it. These considerations are often of great importance, and frequently of far more consequence than is commonly imagined.

As systems, two or three proposals may be of almost equal excellence, and yet one be greatly preferable to either of the others for one particular class of work, or for one particular body of workmen. The management which does not appreciate such facts has much to learn. A wide-awake alert control will carefully weigh pros and cons, making sure first of all that the data are sufficiently complete whereby pros may be juxtaposed to cons.

Perhaps the one factor which those responsible for the inception and execution of a programme have most of all to keep well in mind is just the human side of the business. The inherently sound and efficient scheme must be worked soundly and efficiently by ordinary workmen. This provides indeed the acid test. If a scheme fails here, be it otherwise never so perfect in conception and design, it fails everywhere. It is a beautiful corpse. The ideal is to provide a programme at once adequate for present requirements and sufficiently elastic to meet future contingencies, to do these things as economically as careful planning and forethought can devise, *and to inspire the hearty co-operation of those who are to work the programme.* It is only when the last provision is met that efficiency becomes an assured fact. More than anything else, success or failure depends upon how the men themselves respond. A moderately effective scheme *per se* can reveal a very considerable measure of success when the human factor functions in the neighbourhood of unity, while a perfect machine may give low output because the human material introduces a very high friction co-efficient. Now the management, where the latter happens to be the case, has need, often enough, of the wholesome corrective of introspection. It is seldom that failure is all due to the other fellow. Friction never arises where only one surface is involved. They who work a scheme, and also they who provide it, are equally concerned—the latter quite as much, if, indeed, not more, than the former. Thus on all counts it is certainly up to the management to do all things possible to facilitate smooth and easy running of a well-designed machine. Fair play, a square deal, scrupulous impartiality; legitimate inducement to real co-operation; an appeal to the loyalties—one loyalty seeking the other: and a genuine stressing of the essential community of interests—these things are not only inherently good things, they are sound payable propositions.

But there must be mutual giving and taking. There cannot be efficiency without reciprocity. So it is up to the operatives to do their bit. On their side of the bargain they do well to insist that their efforts shall not be exploited. Naturally if they produce better, and substantial benefits accrue to the company thereby, they expect some proportionate return. Where, however, such a principle be accepted, and an honest attempt be made on each side to deal fairly, in effect there is at least an embryo co-partnership. If success, however, is to be really assured, the workers themselves must do their part loyally, even enthusiastically. Once they realise that their efforts count, that the work they do is appreciated, that they themselves really participate in the progress they help to make, those worth their salt will work both hard and well and with added interest in what they do.

In the nature of things there is no inherent reason why management and executive should not work together in willing, even cordial, co-operation. They are team horses between one pair of shafts; they are partners in one concern. They are fellow mortals, or immortals. Their main interests in home, wife, and family in general run on all fours. Outside the company's premises they have, many of them, in many things, kindred tastes and like pursuits. Why should they not come to respect each the other, to understand that mutual helpfulness *within the works gates* is a good thing and, on the whole, a paying proposition? It is—if there is mutual confidence and mutual respect, and a concerted effort. So-called class distinction, or class-consciousness, breeds suspicion and all the evil brood which saps the nation's strength and hinders the nation's prosperity. It is suicidal; it is fractricidal.

Efficiency is ever the outcome of harmonious and effective effort. It needs that those organising and those executing the work carry it through with skill and in accord. Management and executive each contribute their quota; and success rewards the organisation where these things are the rule and not the exception. But, above all else, the human element must be studied, and the human effort stimulated.

Electricity Supply in Germany.

It is stated that at the present time development is proceeding at such a pace in the electricity supply industry in Germany as to cause managers some concern as to the possibility of fully meeting the demand; this has been particularly the case since the stabilisation of the currency. It has been pointed out in a German newspaper by Dr. Hamm, of Charlottenburg, that, although the increase in the demand of from 10 to 25 per cent. in 1924 was comparatively inconsiderable, the current year has brought about an advance amounting to 50 per cent. on the average. Tnis growth, however, has not been accompanied by a corresponding increase in the receipts, as sale prices have been largely and repeatedly reduced, and the additional income often bears little relation to the greater production. On the other hand, the expanding demand necessitates extensions of plant and networks, for which it is difficult to find the funds. In the circumstance, many of the undertakings look forward with apprehension to the winter, with its inevitable maximum loads, as very few undertakings have been able to extend their plant and networks sufficiently. As most works were only able to enter into contracts for the supply of additional plant in the spring or summer of this year, it will be impossible for the new machinery to be brought into service until the winter of 1926-27, and it is therefore not impossible that "rationing" may have to take place in some districts this winter. In interested circles it is calculated that the consumption will be doubled or trebled in the next few years.

Although the general production of electricity throughout Germany has greatly increased, the number of stations has diminished, as the smaller areas have found it advantageous to obtain supplies from the large and more efficient works rather than to generate on their own account. On the other hand, says Dr. Hamm, the extension of hydro-electric works has not always been very prudent; in the case of the East Prussian works, it has been necessary to duplicate the whole of the machinery, as the water power can only be used during a part of the year.

With reference to the increasing use of crude lignite as fuel, it is stated that, while about 70 per cent. of the total production of energy in 1913 was based upon the combustion of pit coal, the percentage fell to 40 in 1924. Actually, however, the quantities have naturally increased; thus the 70 per cent. of the year 1913 corresponds to 2,800,000 000 kWh, while the 40 per cent. of 1924 represents 4,600,000,000 kWh. But the author considers that this movement will probably again take a downward course, as the lignite resources of Germany, particularly those of Central Germany, will only suffice for a certain time. The technical improvements which are being developed will cause pit coal again to come to the forefront as fuel.

The charges for energy are far below those prevailing in 1913. On the other hand the costs of production in favourable cases are at the former peace time level, but they are frequently much higher so that the financial results of the works do not correspond with the largely increased output. Large consumers in particular are charged prices which, it is said, scarcely cover the cost of production.

In conclusion, Dr. Hamm states that the plant capacity installed in German electricity works in 1924 was 5,350,000 kW, of which 725,000 kW represented water power, 1,830,000 kW lignite stations, and 2,530,000 kW using pit coal. The stations in operation at the end of 1924 comprised 2,068 in private ownership and 1,094 in State or municipal hands. As to the size of the generating stations, in 1913 there were only 13 of a capacity of 20,000 kW and over; at the present time the number is 80, and the capital invested in the power stations, excluding the distribution systems, is put at 1,100,000,000 marks.

London's Electricity Supply.

CONTINUING our comments on the London County Council's Return, to which we referred in our last issue, we note that the aggregate output (sold) of the municipal undertakings within the County was 257 million kWh, and the total revenue was £2,436,713; the output of the companies was 413 million kWh, and the revenue £5,194,477.

From the foregoing figures it will be seen that the municipalities supplied 0.38 of the electricity used in London for 0.31 of the revenue, and the companies supplied 0.62 for 0.68 of the revenue; the average price charged by the latter, therefore, as previously mentioned, was 40 per cent. higher than that charged by the former. The incidence of the figures varies very widely in both cases, as an inspection of the results will indicate. Allowance should be made for the nature of the consuming public in each individual instance; for example, in Kensington the load is mainly lighting, whilst Stepney has a large power load. The average load factors, however, differ but little, being 22.5 per cent. for the Councils and 20.5 for the companies.

For some time correspondence has been proceeding in *The Times* regarding the high prices charged in the City of London, as compared with those offered by municipal undertakings in adjoining boroughs. In the City the conditions are not similar to those obtaining in Stepney and Poplar, where there is an industrial demand, and the lighting hours are longer; the load factor of the City undertaking of the Charing Cross Company last year was 21.5 per cent. and that of the City of London Company only 14.4, whilst that of Stepney was 28.8 per cent. The average rate of interest and dividends paid by the Charing Cross company was 6 per cent. for the year; adding to these payments the amount put to reserve, the total was 11½ per cent. on the capital—a good return, but hardly exorbitant. In the case of the City Company the average rate was nearly 9 per cent., and the total, including reserve, 16 per cent., which is certainly an unreasonably high rate of profit, representing 1.6d. per kWh sold. Now that the fear of 1931 has been removed, the companies will have no excuse for paying large sums to reserve, and as they will come under the sliding scale of prices and dividends, these matters will be settled automatically in future.

The case of the County of London Company is less excusable. With a capital called up of £4,055,000, the average rate of interest and dividends was 8.71 per cent.; the revenue was £1,023,493, and the total expenditure only £370,450. The amount available for distribution was £803,192, or no less than 2.45d. per unit sold, and after paying £355,772 in interest and dividends, the large sum of £491,316 was transferred to reserve, bringing that fund up to £1,705,247. The profit surplus thus amounted to no less than 21 per cent. on the capital.

The Operation of Inter-connected Undertakings.

WHILST there are limits to the advantages to be derived from the inter-connection of generating stations, depending upon the distance between them and the cost of the transmission line, there is no doubt that when the distances are short, very substantial economies can be effected by linking up. These benefits, however, cannot be fully realised unless the load is divided between the respective undertakings to the best advantage. In the case of such a system as that of the North-East Coast Companies, this end is attained by placing the whole of the stations and mains under the direction of a load controller, who is kept fully informed regarding the conditions obtaining in each area.

Where the undertakings are not owned by a single authority, the problem is not so simple. Apart from emergency requirements, such as the breakdown of a generating set at a fully loaded station, which would at once be met without regard to economic considerations, the question is how to regulate the output of the respective stations so as to secure the maximum commercial efficiency. In the *Electrical World* recently Mr. S. Ferguson, president of the Hartford (Conn.) Electric Light Company, explained the method of co-ordination adopted by three interconnected companies of which his own was one. An "Exchange Board" was set up comprising one representative from each company, and a manager was appointed by the Board of co-ordinate daily and hourly the load dispatchers of the three companies. The manager's function was to buy energy for the Board from any company at the lowest possible price at which it could be given at any hour without actual monetary loss—*i.e.*, at its then increment of fuel costs, depending, of course, on the state of the load at the time; at the same time, he sold it to one or both of the other companies, the sale price being again the increment cost. In this way neither the seller nor the buyer benefited financially by the transaction, but all ultimately shared in the economy through the medium of the Board at a monthly settlement.

Electric Washing Machines.

IN this issue, as in our last, we publish some notes and pictures of washing machines to give our readers some idea of the numerous models which are available both here and in the United States. As we have said already, the existence of such a large market for these machines in America seems a sufficient reason for supposing that there are great opportunities in this country. In fact, we may go so far as to say that there is already a fairly good sale for these machines. It may surprise readers to learn that one firm in this country has sold over 6,000 of its electric washers and is still disposing of them at the rate of from 20 to 30 a week. Another company informs us that last year it sold 540 washing machines. It is evident, therefore, that a demand exists; it only remains to be seen how best it can be cultivated. Most people to whom the question of washing machines is mentioned immediately point out the disadvantages of these appliances. It is a common thing for articles beyond the reach of our pockets to be considered in this light. A motor-car, for instance, requires garage space, tires are an expensive item, the engine is always needing taking down, and so forth. Similarly, we think that a great deal of the antipathy (and apathy) displayed towards washing machines is traceable to their cost. In the United States this has been met to a great extent by the adoption of hire-purchase systems, but there is no doubt that something more than this is necessary in Great Britain. It is useless to point to the saving of labour or laundry charges effected by the machines, if their price is too high. The clothes are not finished with when they leave the washer; several operations still remain to be done. Labour saving is a great point—in fact, *the* point—of the electric washing machine, but perhaps labour can be saved at too great a cost. It is surely not beyond the powers of our people to devise a machine which will cost the public about a half or even a quarter of the price at which most electric washers are now sold. The "Gaslectric" machine described in our last issue seems to be a step in the right direction as regards both cost and convenience.

Electric Washing Machines.—II.

In our last issue we illustrated and described a number of washing machines which are upon the British market, but we omitted one machine which has gained a certain measure of popularity in this country—the "Thor," which is illustrated in fig. 10, and is supplied by the Hurley Machine Co. This has a reversing-revolving

Fig. 10.—The "Thor" Washer.

cylinder driven by a 0.25-h.p. B.T.-H. motor. All the driving mechanism is totally enclosed, and thus all danger is eliminated. A friction drive is provided, so that any overload which may occur immediately stops the machine. The means of control are simple—a single switch and two levers, one for the cylinder and the other for the wringer. The latter consists of a pair of 11-in. cushioned rollers. The machines are made in a number of sizes ranging from that suitable for a small flat to a machine designed for institutions.

The Hotpoint-Aerobell washing machine (fig. 11), made by the Hotpoint Electric Appliance Co., Ltd., was also omitted from our last issue. This washer has a reciprocating-revolving shaft bearing vacuum cups. The motor and driving gear are entirely enclosed and an efficient lubrication system is embodied in the machine. The cylinder is made of copper, and the container is also of copper, tinned inside and highly polished outside. The washer is capable of dealing with eight full-sized sheets.

In this part of the article we propose to introduce our readers to a number of American patterns, which, it will be seen, vary greatly in construction and operation.

The "White Lily Ace" washer, illustrated in fig. 12, is of simple design, consisting of a wood or copper tub mounted on a movable framework. This has a capacity of eight full-sized sheets and the "agitator" and wringer are of aluminium.

Fig. 13 illustrates an entirely different pattern. This machine—the "Klymax"—operates on the vacuum cup principle. There are three cups mounted on a central arm; these are given a reciprocating motion, up and down, and are claimed to suck the dirt from the clothes. The cups operate in a perforated cage, which is arranged to run at high speed, so that when the clothes are washed they can be placed in this cage and dried on the centrifugal principle. The machine is usually provided with a gas heating arrangement for the water. There is a direct flexible shaft drive, and the moving parts work on ball bearings. The motor is only of 0.25 h.p.

The "Haag Vortex" machine, fig. 14, is also of a novel pattern, consisting of a metal tank, below which is mounted the motor and enclosed driving gear, the latter operating a dolly fixed in the centre of the tank. This dolly has four wings which have a beating action upon the clothes. An auxiliary shaft passes from the driving gear into a small gear box mounted on the top of the tank from which the wringer is driven.

The fourth example (the "Whirldry," fig. 15) is another machine on the centrifugal system. From the illustration it will be seen that in the upper part of the tank is a rotating cage containing a four-winged dolly. When the washing operation is completed the level of the water is allowed to fall or the tank is drained, and the cage is run at a high speed to extract the moisture from the clothes.

The "Gainaday" washer, depicted in fig. 16, is of the rotary container type with the motor and driving gear entirely enclosed, including the auxiliary gear at the top of the tank which drives the wringer. This machine is of a very compact nature and handsome in appearance.

The "agitator" principle is employed in the "Horton" machine, illustrated in fig. 17, the agitator being a central dolly with three vanes made of cast aluminium, which is claimed to produce a speedy washing action. It is mounted in the top of the tub. The motor and gear, as shown, are well enclosed. It will be noticed that in most of these machines the wringer gear is of the same type, *i.e.*, an auxiliary shaft operating a right angle drive in a small gear box mounted at the top of the tank. The interior of the tub in this machine is nickel plated, and the outside highly polished.

Another vacuum-cup machine is the "Trojan," fig. 18. In this the cups not only reciprocate, but they also slowly revolve, the motion being provided by an eccentric gear operating the central shaft. A tripod stand on castors is provided; the tank is of metal, and the usual form of wringer drive is incorporated.

In the "G.R.S." electric washer (fig. 19) is a revolving aluminium cylinder which reverses its direction at each few revolutions. The cylinder is contained in a

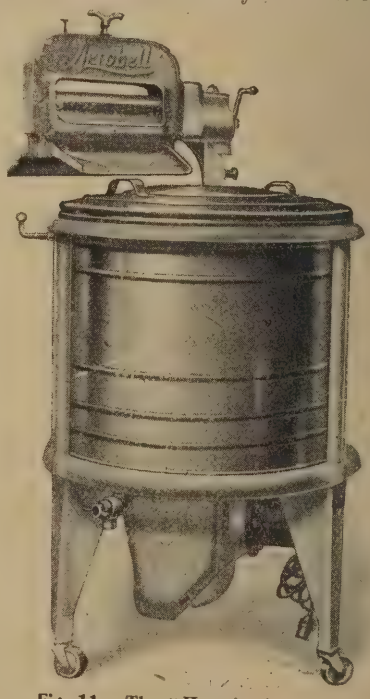

Fig. 11.—The "Hotpoint-Aerobell."

square tank; the gear is heavily protected and the wringer can be swung in any direction.

Fig. 20 depicts a very ornate machine, produced by the Coffield Washer Co. In this a reciprocating cylinder is mounted in an outer container built mainly of aluminum, which is highly finished. This machine is not only of great utility; it is also a handsome piece of furniture.

Of a somewhat different nature is the machine illus-

Fig. 27.—The "Fem" Washer.

Some Examples of American Washing Machines.

trated in fig. 21—the "Prima" washer. This consists of a plain tub mounted on gimbals which has a spring-loaded reciprocating motion. The wringer is mounted on a separate rigid post, through which the auxiliary driving shaft is taken.

The "Bock" machine, shown in fig. 22, is built on rather novel lines. It operates upon the principle of dynamic balance, which permits a speed of 1,750 r.p.m., for the proper extraction of moisture, without vibration. The actual washing is done by a reciprocating dolly actuated by the gear seen clearly in the illustration. The wheel at the right-hand side performs the necessary switching operations.

Another washer of the cup type is the "Sunnysuds," depicted in fig. 23. The cabinet is cut out to procure lightness and the tub is given a reciprocating motion, and, moreover, a "washing board" effect is obtained by a series of long horizontal indentations in the sides of the container. The usual swinging wringer is fitted, and the motor is mounted on a shelf immediately below the reciprocating tub.

Fig. 24 shows the "Laundryette" machine, in which the totally-enclosed motor is hung from the top frame, facilitating replacement. As will be seen, all the moving parts are effectively enclosed, and the machine is said to work absolutely without noise owing to the type of drive fitted—a silent pinion on the friction wheel hub and a specially-designed bronze slide on the backshaft. The drive from the motor to the central spindle is by belt.

A cut-away view of the "Double A" washer appears in fig. 25. This machine has an inverted dolly which operates at the bottom of the container. The usual form of wringer drive is fitted, and the motor is started and stopped by the lever seen in the left of the illustration. An automatic oiling arrangement is one improvement incorporated in this machine.

The "Federal" washing machine depicted in fig. 26 is characterised by a serviceable appearance. It is an oscillating-cylinder model, and the driving motor and wringer shaft are enclosed in the casing of the body, making the machine one of the safest to operate among all the types here illustrated.

The "Fem" machine, illustrated in fig. 27, employs a perhaps unique arrangement. The clothes are held motionless between two screens while the water is forced up and down by a piston which is operated by the motor mounted on the top of the copper tank. The machine has only one small gear wheel, which is enclosed in a housing.

In concluding this article we desire to express our acknowledgment to *Electrical Merchandising*, from whose advertisement pages some of the illustrations have been reproduced.

Electricity Supply in Great Britain.—VIII.*

Gloucestershire and Wiltshire.

Nearly all of Gloucestershire and more than half of Wiltshire are included in the Lower Severn Electricity District as provisionally determined by the Electricity Commissioners, and, with the exception of the Salisbury Electric Light and Supply Co., Ltd., all the other authorised undertakers in the list below are concerned with this District.

In this connection it is interesting to note that the Electricity Commissioners' Fifth Annual Report mentions that the stage is approaching when the question of the reorganisation of supply in this District will need to be reopened.

We also wish to draw attention to the remarkable similarity between the increase in output of this District (Area No. 1) and that of the counties of Dorset, Hampshire, Sussex, &c. (Area No. 19), which we have recently dealt with in this series. The figures are taken from Table 8 of the Electricity Commissioners' annual pamphlets, "Generation of Electricity in Great Britain."

Year ended March 31st.	kWh generated. Area No. 1.	Area No. 19.
1922 ...	77,943,016	76,313,651
1923 ...	89,456,059	88,869,613
1924 ...	105,394,934	104,884,274
1925 ...	119,257,004	120,094,019

The northern part of this District is a typical example of the chaotic conditions at present confronting the Commissioners. The Rural District of Tewkesbury (Glos.), for instance, has been applied for by three different undertakers. The frequencies of their systems are 25 cycles, 50 cycles, and 100 cycles respectively.

The undertaker with the 25-cycle system has just been granted statutory powers, under Section 17 of the Schedule to the West Midlands Electricity District Order, 1925, to supply electricity for all purposes in the part of Worcestershire included in the Lower Severn Electricity District, and in the detached parts of Worcestershire (Nos. 3 to 7 inclusive), as well as in certain parts of the Counties of Salop and Stafford.

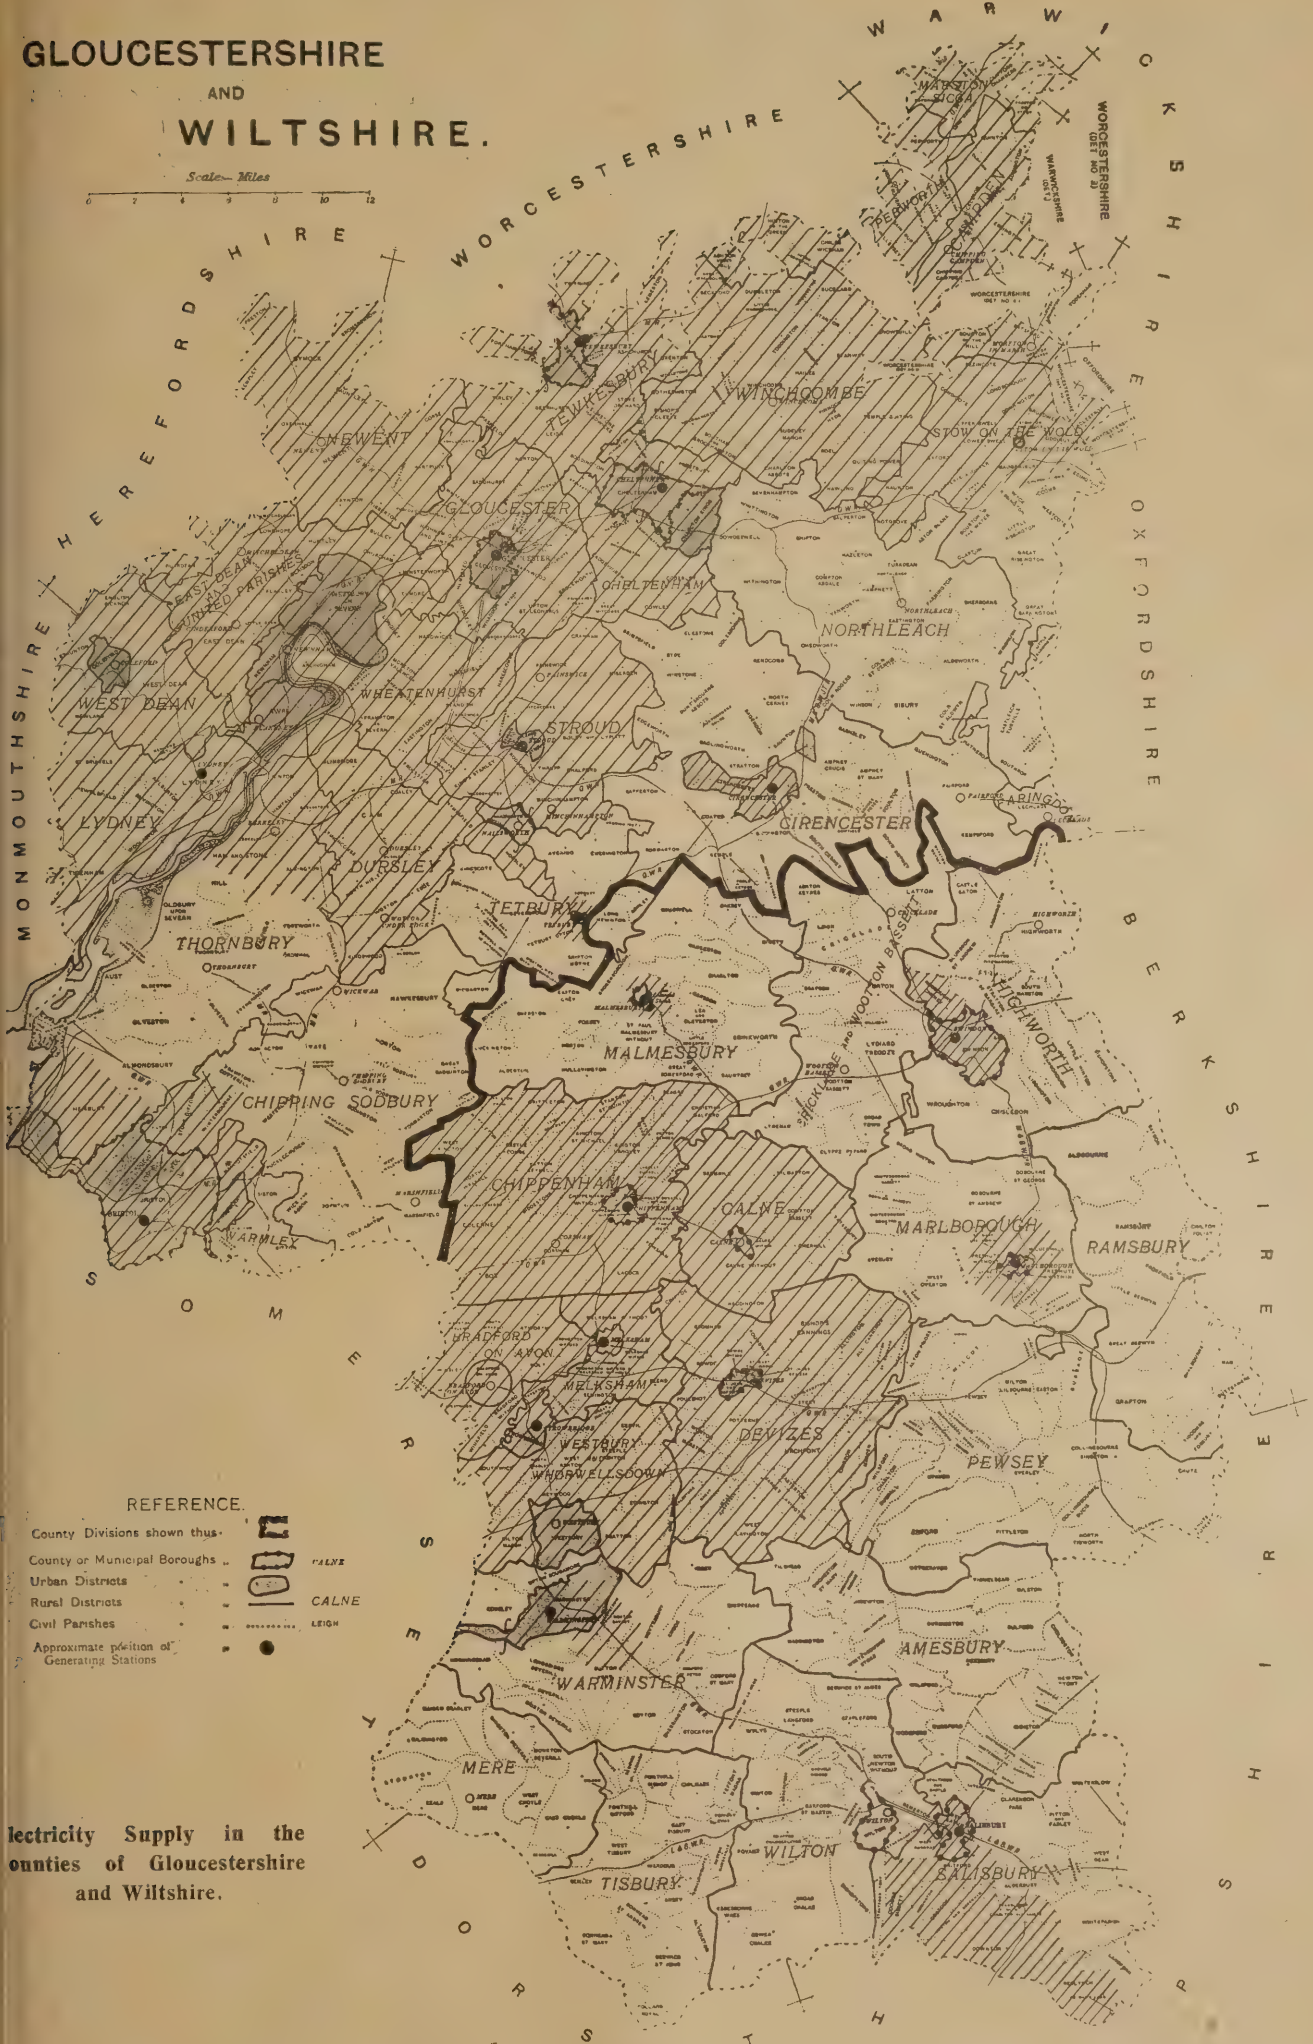
The following table gives particulars of the above and other areas for which competing applications have been lodged:—

Name of authorised undertaker.	System of supply.	Areas for which competing applications have been lodged. Tewkesbury R.D. (Glos.)	Winchcombe R.D.	Gloucester R.D.	Cheltenham R.D. (part.)
—	—				
Shropshire, Worc. & Staffs. E.P. Co.	A.C. 25 ~	×	×	—	—
West Glos. Power Co., Ltd.	A.C. 50 ~	×	—	×	×
Cheltenham Corporation	A.C 100 ~	×	×	—	×
Gloucester Corporation	D.C.	—	—	×	—

× = Application lodged.

No applications have yet been lodged in respect of the areas on the map on the opposite page which are not hatched, nor do they belong to any authorised undertaker.

The following is a list of the authorised undertakers whose areas of supply are wholly or partly included in the map:—



Local Authorities.

Bristol Corporation.
Calne Corporation.
Cheltenham Corporation.
Gloucester Corporation.
Marlborough Corporation.
Swindon Corporation.

Companies.

West Wilts Electric Light & Power Co., Ltd.

* Parts I-VII of this series appeared in the Electrical Review of October 9th, 16th, 23rd, and 30th, November 13th and 20th, and December 11th, 1925.

Electricity Supply in the Counties of Gloucestershire and Wiltshire.

The 1921 Census gives the following particulars for the Administrative Counties of Gloucestershire and Wiltshire and the associated County Boroughs:—

Acres.	Persons	Resident families.	Buildings not containing dwellings.
1,669,943	1,049,859	252,355	16,130

The map is reproduced from those prepared for the 1917 Boundary Commission, by permission of the Controller of H.M. Stationery Office.

In order to bring the map topographically up to date, a list of alterations made since 1917 is given below:—

(1) The County Borough and Parish of Bristol has been enlarged by the inclusion of parts of the Parishes of Thornbury and Easton-in-Gordano.

(2) The Parish of Downton has been divided into two new parishes, called the Parish of Downton and the Parish of Morgan's Vale and Woodfalls.

(3) Parts of the Parishes of Upper Swell and Maugersbury have been added to the Urban District and Parish of Stow-on-the-Wold.

(4) Part of the Parish of Tetbury Upton has been added to the Urban District and Parish of Tetbury.

(5) The Parishes of Marlborough Saint Mary, Marlborough Saint Peter and Saint Paul and Preshute Within have been united to form the new Parish of Marlborough, co-extensive with the Borough of Marlborough. The Parish of Preshute Without has been re-named the Parish of Preshute.

Note.—With reference to alteration (2) it will be seen that the whole of the Parish of Downton as shown on the map has been hatched, although the Parish of Morgan's Vale and Woodfalls is not mentioned in the description of the area applied for as set out in the London *Gazette* of May 22nd, 1925, page 3,463.

A Unique Electric Sign.

Some Particulars of the Huge Colgate Sign.

What is claimed to be the largest electric sign in England, the new one recently erected on the south bank of the Thames, between Charing Cross and Westminster Bridge, to advertise Colgate's toilet productions, presents some particularly interesting electrical and mechanical features. It covers a vertical area of 5,000 sq. ft., and is carried on a steel frame quite independent of the building in front of which it is erected. The frame, which weighs over 60 tons and is of a very elaborate design, to sustain the various stresses of wind pressure, &c., is carried on four 9-in. × 11-in. steel stanchions; these stand on concrete bases, each having a volume of approximately 300 cu. ft. The words

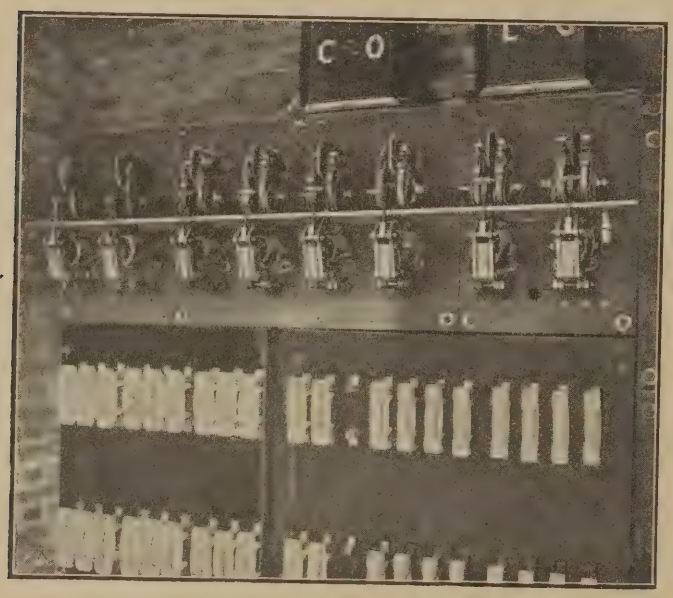

Fig. 1.— Large-Letter Control Gear.

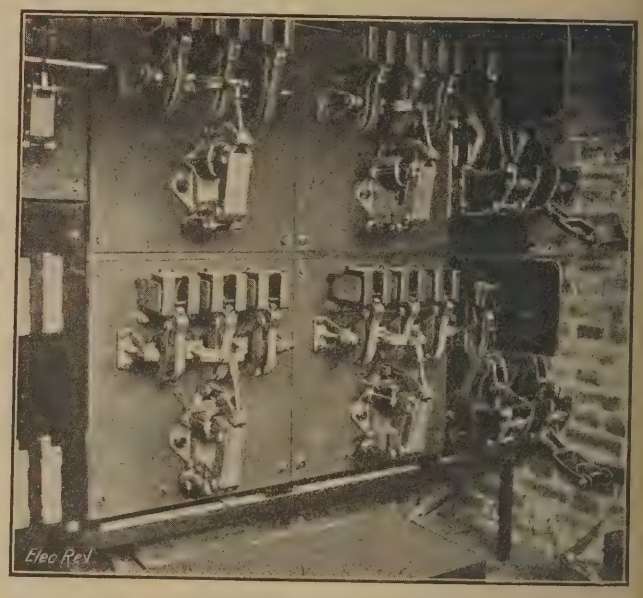

Fig. 2.—Main Breakers and Contactor Switches.

"You'll Come To Colgate's By Degrees," and a thermometer, 60 ft. high by 12 ft. wide, which records the correct temperature at all times, are portrayed by night and day. The large letters (Colgate) are 12 ft. 6 in. high, and average each a weight of a quarter of a ton; the smaller letters are 5 ft. high. All of them are constructed of white vitreous enamelled steel, giving a good visibility during the daytime and an excellent distinction when illuminated at night. The loading of the sign is approximately 100 kVA. The supply is received from the London Electric Supply Corp. at a pressure of 2,500 V, and is reduced to a working pressure of 105 V by two 50-kVA transformers on the site. The general installation is made up in two sections, which are protected by two 2,000-A d.p. breakers, fig. 2, right. Each section is controlled by a pair of 1,000-A contactor switches, fig. 2, which are governed by a Venner time switch. Each of the larger letters is operated by a small d.p. contactor switch, fig. 1. The lighting of the smaller letters and the mercury column is arranged to be intermittent and these with the small contactor switches are operated direct by a rotary flasher, fig. 3. This is built up in five sections, each section being controlled by a separate brush switch. The flasher is operated through spur gearing by a small a.c. motor, and is contained in a sheet-metal case at the foot of the control board, figs. 1 & 2. The flasher is so adjusted that at no period is the sign completely out.

The main feature of the sign is the visible thermometer, which is shaped to represent a huge "tube" of dental cream. It is constructed of sheet steel, with raised opalite figures and degree spacers illuminated from the back. The mercury medium is represented by a central white column. From the top of the "thermometer" is suspended a black "apron" covering the upper portion so that the height of the remaining part indicates the temperature as measured by an electrical resistance thermometer mounted close at hand. The "apron" is raised or lowered as the temperature varies, by means of a small d.c. motor housed in the top of the "thermometer." The control apparatus for this motor consists of an ingenious system of electrical relays governed by a regulating device in the form of a Wheatstone-bridge circuit, in which the coil of the electrical resistance thermometer forms a part of the "unknown-resistance" arm. The other three arms are made of a material the resistance of which is not affected by

changes in temperature. A slide-wire resistance is placed between the "unknown" and the "variable" arms, and the final balance is obtained by means of a moving contact. The "bridge" circuit is energised by a 1.5-V battery, and a moving coil galvanometer is connected across the "bridge" in the usual manner, the moving contact on the slide wire resistance making one terminal. The galvanometer coil is suspended between the upper poles of two vertical bar magnets. An aluminium pointer is attached to the galvanometer coil, and carries at its extremity two small thermo-couples T_1 and T_2, fig. 4, which are connected electrically to a moving-coil relay. The latter is placed between the bottom poles of the vertical bar magnets. An electrically-heated spiral H, fig. 4, almost embedded within a metal block, so that the heat is

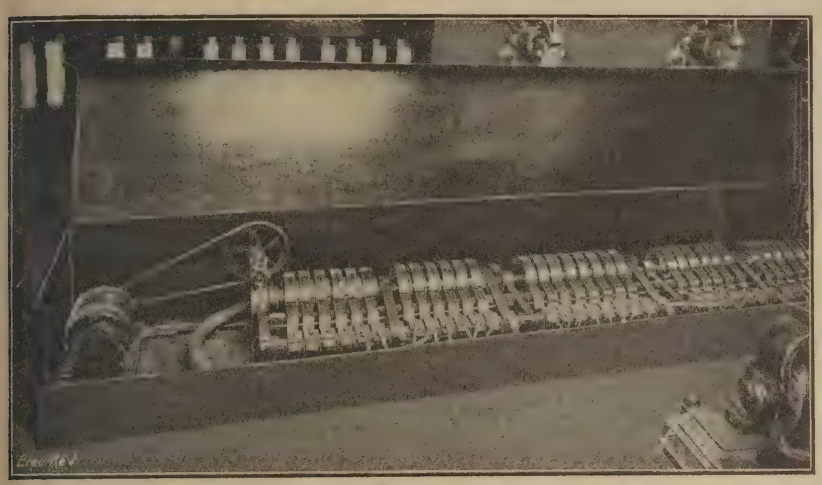

Fig. 3.—Rotary Flasher.

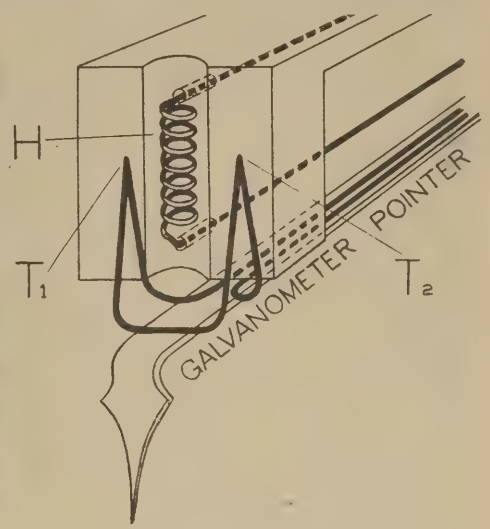

Fig. 4.—Thermo-Couples and Heater.

localised at one point, is placed immediately behind the thermo-couples. The heater is energised by a 14-V supply from a small transformer fed from the 105-V mains direct. At "bridge-balance" the pointer is in its neutral position, in which the heater is midway between the two thermo-couples. A change in the resistance coil of the electrical thermometer, brought about by a temperature change, throws the "bridge" out of balance, and hence deflects the pointer of the galvanometer. This brings one of the thermo-couples nearer to the heater; an e.m.f. is thus generated in the couple, which operates the moving-coil relay. The galvanometer complete with the thermo-couples and the heater, and the moving-coil relay, are mounted as one unit in a metal case. In a separate case are mounted two secondary or power relays. One of these is energised when the moving-coil relay is deflected. The vertical spindle of the latter forms a common terminal of the two secondary relays, and on either side of the spindle are two contacts which form the other terminals, one for each relay. When the spindle is turned by the deflection of its coil, connection is made with one of the side contacts, and the corresponding secondary relay is energised. These relays are connected so as to control the ½-h.p. operating motor in opposite directions, so that the "apron" will rise or fall. Energy for the secondary relays is supplied from the same transformer as the heater. The operating motor is supplied from a small motor generator, and the field is permanently "on," the secondary relays being arranged in the armature circuit. It is also connected through a reduction gear to the slide-wire contact of the variable arm of the Wheatstone bridge so that, as it raises or lowers the "apron," it also adjusts the contact until the bridge is re-balanced. The galvanometer is thus brought back to zero and the relays cease to operate and the motor is brought to a standstill. An efficient brake fitted to the motor ensures an almost instant stoppage of the "apron" movement. During periods when the temperature is rising or falling sharply, the relays are actuated about once in every three minutes, and during times of steady temperature, about once every half-hour. A second time switch governs the "thermometer," which is in operation from 6 a.m. to 12 m.n. The sign was designed and erected by Boro' Electric Signs, to whom the Cambridge Instrument Co., Ltd., was responsible for the design and installation of the temperature control apparatus.

Notes on Trolley-'Bus Traction.

An Interesting Undertaking in France.

By THEODORE RICH.

SINCE the war the trolley-'bus as a factor in passenger road transport has greatly increased in importance in a number of English cities. It has recently been taken up seriously in France. It may be remembered that at the Paris Exhibition in 1900, in the Vincennes Annexe, one of the features was a trolley-'bus on the Lombard-Gerin system; the 'bus was connected by cables with a motor-driven over-running trolley, the speed of the trolley motor being in synchronism with the driving motor of the 'bus, as the former was driven from slip-rings on the latter.

In some towns and districts in England the development of the trolley-'bus has been encouraged by legislation dating from the horse-tram days, requiring such undertakings to keep in repair the roadway between the rails. It is not realised that this regulation was in itself originally made to comply with the demands of local authorities for tribute from the capitalistic concerns that initiated tramway enterprise; nowadays when tramway problems are discussed, it is amusing to hear the complaints of the L.C.C. and other local authorities on this score, as what was sauce for the private-enterprise goose has turned out to be sauce for the "people's own" gander. Some authorities have put down railless trolley sections to avoid expenditure on overdue track repairs, and to avoid road maintenance expenses being charged to the tramway account; this is "robbing Peter to pay Paul," as the charge for road

upkeep comes on the ratepayers whichever way it is done.

In all questions as to road traffic whether it is a matter of tramways, trolley-'buses or motor-'buses, the vehicles, unlike an aeroplane which travels on air or a steamship that travels on the ocean, have to run on some form of track that is liable to wear out, and somebody has to pay for the upkeep; the passenger assists through his fare and the public through local rates directly

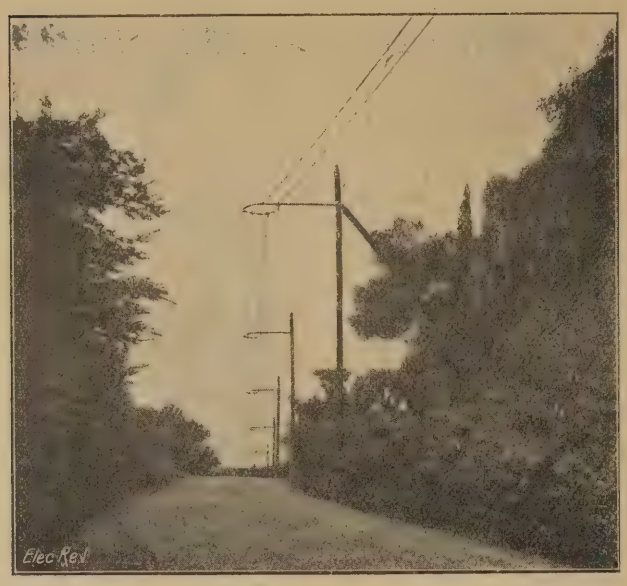

Fig. 1.—Trolley Line carried by Wood Poles.

or through purchases from local tradesmen—the money comes from somewhere. The trolley-'bus has undoubtedly a sphere of usefulness, but the system will be more injured than benefited if it is adopted to aid figure juggling by local authorities.

On the Continent.

In France as in England, due largely to the incessant demands of labour in so-called sheltered undertakings, the cost of construction and the expenses of maintenance of tramways and light railways have gone up enormously since 1914. Some undertakings in France, even where supported by local authorities, have had practically to treble their fares, and in some cases traffic has been reduced to about three trains per day each way.

In Italy during the war, owing to the high cost and difficulty of obtaining petrol, the trolley-road traction system underwent rapid development, and at the time of the Armistice several hundred kilometres of temporary and other trolley line had been erected for military purposes. In the South of Germany over twenty years ago a trolley-lorry system was started to haul stone from some quarries. There are in the United States a certain number of systems at work, although in early days the abominable state of American roads had a great deal to do with the rapid development of street and interurban electric traction, the more recent improvement in roadways bringing into competition in some places what are termed the " jitney " 'buses. In modern times the production of aluminium and magnesium on a commercial scale, great improvements in springing, the invention of solid and pneumatic rubber tires, the use of pressed steel sections to reduce the number of rivets and fastenings, and the improvements in steel and its alloys which enable much higher stresses than before to be taken by shafts and toothed wheels, have all tended to encourage road-borne as compared with rail-borne traffic.

It was largely the excessive wear and tear of the old steam coaches started about one hundred years ago that stopped mechanical road transport for such a length of time.

Trolley-'bus v. Petrol-'bus.

Not long ago M. Lévéque, chief engineer of the French Government Département de Ponts et Chaussées with a M. Gex, made a study of the trolley-'bus and motor-'bus question, and came to the conclusion, at the prices of commodities and services then ruling, that while a motor-'bus cost 1.25 fr. for petrol, 0.24 fr. for lubricating oil, and 0.04 fr. for grease per 'bus-kilometre, an equivalent trolley-'bus cost 0.07 fr. for energy at 0.10 fr. a kW-hour, and lubricants 0.04 fr., the ratio for these items combined being about 13 to 1. After allowing for interest on first cost, depreciation, wages and repairs, the petrol-'bus cost 3.73 fr.; as against 2.55 fr. per 'bus-kilometre. The cost of wages and commodities has gone up since those figures were calculated, but the ratio has not varied very greatly.

The question of the trolley-'bus was also dealt with in some detail in a paper read before the Société Française des Electriciens on July 5th, 1922, by M. M. Igléses, one of the engineers of the Constructions Electriques de France. He points out in his paper that from the point of view of comfort, the trolley-'bus is superior to the petrol-'bus because it is more silent, vibration is practically eliminated, and the unpleasant sensations of gear changing are avoided. It should be noted, however, that in the petrol-electric system of 'buses these difficulties are also largely avoided. From the point of view of French as well as English interests, so long as war risks remain conceivable, current derived from water power or native coal must be preferable to imported petrol which is subject to the operations of chamelionic international financiers.

As compared with the normal type of tramcar with rail return, the two-conductor trolley system practically eliminates all danger from electrolysis of pipes, &c., and such expensive expedients as negative boosters to comply with the seven-volts Board of Trade rule can be avoided. There is no doubt that there is scope for all three kinds of traction—tramways where cars run very frequently, and long double-deck bodies can be used; trolley-'buses where traffic is lighter; and motor-'buses where traffic is either very light or where the conditions in the streets in large towns make self-contained power vehicles a necessity.

When considering such questions, among the main factors are to be found cost of power in bulk, and average cost delivered to the trolley line, equivalent cost of petrol, wages, lubrication, repairs and depreciation, and interest charges on sub-stations, trolley lines, vehicles and equipment, tires, and car-sheds. Monsieur Iglésis, in the paper referred to above, gives some interesting formulæ and diagrams by which the relative spheres of usefulness of the different types of traction can be estimated. The existence of a power supply at

Fig. 2.—Interior of Trolley 'Bus.

convenient points along the route under consideration naturally favours the adoption of electric traction, as the cost of construction of a special power house is thus avoided.

A French Trolley-'bus System.

In France in recent years the motor-'bus has to a large extent taken the place of the old " diligence," and

to a certain extent that of the carrier's cart. In towns in the South, for instance, one finds 'buses with some seats inside which can be folded up, and part of the space used for all kinds of merchandise, from a sack of potatoes to a Paris hat in a hat-box; such 'buses radiate from market towns or connect neighbouring towns. It is this sort of traffic which, when sufficiently large, can under favourable conditions be adapted for trolley-'bus and trailer operation.

An interesting installation of trolley-'buses on the "railless" system is now at work between Nimes and Pont-du-Gard, in the wine-producing district to the west of the mouth of the Rhone. These two towns are joined by two trolley routes, one direct 25 km. (15½ miles) long, and the other forming two sides of a triangle 35 km.

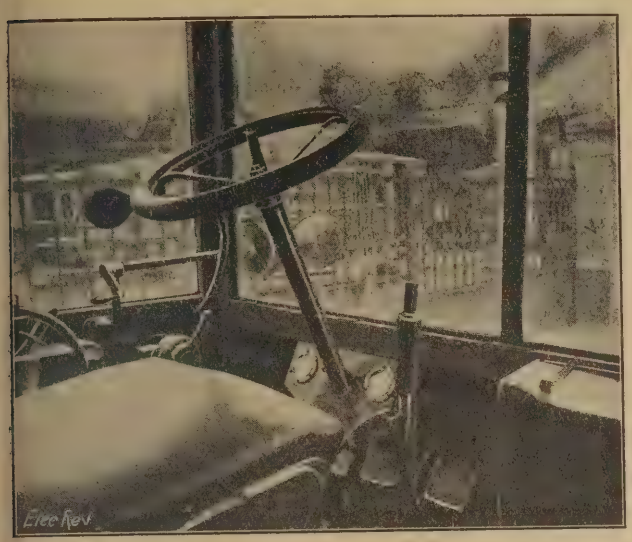

Fig. 3.—Driver's Compartment.

(21¾ miles) long, a number of small places being passed on each line. The equipment has been carried out by the Constructions Electriques de France, of Paris and Tarbes, a company that has a technical alliance with the English Electric Co. The roads followed are not of a uniform character; in places they are only 6 metres wide (19 ft. 6 in.). The gradients are not heavy, the maximum being 1 in 16.6.

Sub-Stations.

The power is supplied by the "Sud-Electrique," a company which distributes power over a large area in the South of France; it is delivered at 13,500 volts to two sub-stations, one at Lafoux, near Pont-du-Gard, and the other at Comps at the point of the angular loop. The equipment of both sub-stations is identical, comprising one 13,500 to 500-volt transformer, a slip-ring induction motor 150 h.p. 500 volts at 970 revs., direct coupled to a 100-kW d.c. shunt generator 550 to 750 volts. There is a high-tension and low-tension switchboard on the three-phase side, a d.c. generator panel, and two feeder panels.

There is also an accumulator sub-station placed between the two branches near the Nimes end of the triangle, near the centre of gravity of the system. The battery discharges automatically in the case of failure of the supply current; it is of 750 ampere-hours capacity, with 270 cells, plus 10 regulating cells. It is large enough to take care of the whole load of a normal day's traffic; for that reason there is not the usual necessity for spare gear in the motor-generator sub-stations. The sub-stations, generally speaking, look after themselves, although there is one man in charge of each. The accumulator sub-station runs without anybody being in charge, although it is regularly inspected.

Trolley Line.

The trolley line, see fig. 1, consists of two copper conductors, 87 sq. mm. section (.135 sq. in.), suspended from brackets attached to wood posts, the posts being kept off the ground by means of Pousolle type concrete bases. The posts average 7 m. 50 (24 ft. 7 in.) long, 14 cm. (5½ in.) at the tip, and 22 cm. (8⅝ in.) at the butt. The average distance of the posts apart is 25 metres (27.3 yd.). There are ten lightning dischargers on the trolley lines averaging 5 km. apart.

Coaching Stock.

The stock of vehicles consist of 10 trolley-'buses and 15 trailers of various types. The 'buses have an overall length of 7 m. 985 (31 ft. 5 in.), a width overall of 8 ft. 2½ in., a wheel base of 4 m. 40 (14 ft. 5 in.), and a wheel track of 2 m. 10 (6 ft. 10½ in.). The 'buses weigh 8 tons in working order, unloaded; one of them is shown in fig. 5, p. 1012. The forward (steering) wheels are fitted with 1,030 by 180 solid rubber tires, and the back (driving) wheels have twin tires 1,030 by 160.

There is seating accommodation for 34 persons, with standing room for four more (see fig. 2). Luggage racks are fitted, a matter of convenience where the length of a journey runs into several miles; on many 'bus and tram routes in the British Isles racks would also be a convenience. The seats are crosswise, as with the more recent London 'buses; a cross seat tends to more rapid discharge of passengers than longways seats, as people spot quickly where they are, and where the route is picturesque one can see out of the windows much better.

The 'buses are fitted with extraction ventilators; the seats are covered with rattan, and the electric lighting is arranged for by means of glass bowls in the ceiling. There is a baggage compartment at the rear which will take half a ton of passengers' luggage or merchandise; four tip-up seats are arranged in it for emergency use. Fig. 2 shows the interior of a 'bus looking towards the baggage compartment.

The passengers enter the 'bus at the front end on the right-hand side next to the curb, as traffic in France is to the right hand and not to the left as with us. A glass screen separates the driver (who also acts as the conductor) from the main compartment; passengers as they enter pay their fares and take their tickets through a window in the glass screen. Fig. 3 shows the driver's compartment; as will be seen, the seat is on the left.

Electrical Equipment.

Each trolley-'bus is fitted with two motors; each motor is of the DK 26 B type, fitted with four main poles and commutating poles. They are of the general type developed by the English Electric Co., hence the nomenclature DK. Each motor develops 20 h.p. at the car axle when the armature is running at 1,000 revs. per minute; the drive is by means of a worm and helicoidal wheel, so that the use of a differential is avoided.

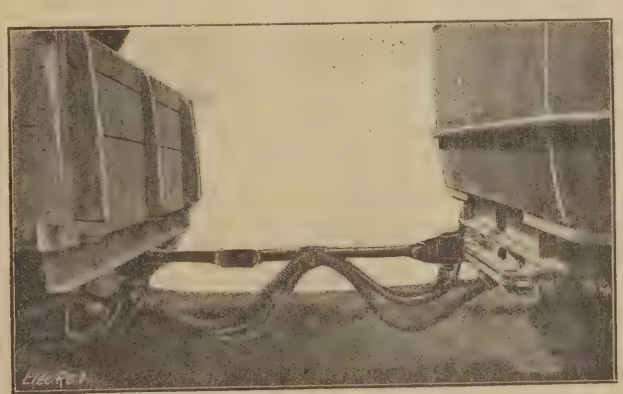

Fig. 4.—Draw-Bar, Brake Pipe and Cables.

The driver operates the controller by means of a pedal, which is notched up by successive pressings, the cylinder being returned to the off position by means of a coiled spring when the pressure of the foot is released. The reversing cylinder is operated by hand. The controller has nine running contacts, five for series and four for parallel operation; the last two positions are for shunting the fields at top speeds. The controller is fitted with solenoid blow-outs of the type with which the English Electric Co., as successors to Messrs. Dick, Kerr

and Co., has been identified since the days of the late Mr. Short.

The trolley poles are of the standard "Railless" pattern, which allows the 'bus as much variation on the roadway as is reasonably necessary for traffic conditions.

In addition to the usual resistances and resistance connections required for the starting of the main motors, for shunting the fields, and for operating the rheostatic brakes, there is a group of resistance frames which can be adjusted to suit the number of motor-propelled trailers forming a train when operating on a "mixed" service.

Fig. 5.—Trolley 'Bus and Self-propelled Trailers.

There are three systems of brakes—

(1) A hand brake acting on drums on the motor shafts.

(2) Rheostatic brakes controlled by a foot controller.

(3) A compressed-air brake acting on drums on the rear wheels, actuating also the brakes on the trailer cars.

There are two air-compressors, one driven by means of a chain off the shaft of each motor. As a rule, the hand and rheostatic brakes are used when the 'bus is run alone, the air brakes being usually used when there are trailers.

Trailers.

The trailers are 4.735 metres (15 ft. 6 in.) long, 3.19 metres wide, and have a 3-metre wheel base; they can carry a useful load up to four tons each. Each trailer is equipped with a 20-h.p. motor of the same type as the main 'bus motors; the rear axle is driven by means of wormgear. Electric couplers and cables connect the trailer motor or motors to the driver's cabin on the 'bus, and after suitable adjustment of the resistances, the trailer motors can be operated by means of the main controller pedal. Tests have been made with five trailers, but under normal traffic conditions the "mixed" service is operated with two trailers. Van bodies suitable for the transport of fruit and vegetables are fitted on some of the trailer chassis, and others are fitted with box bodies for the conveyance of sand, &c. Fig. 5 shows some of the trailers. Fig. 4 shows the draw bar, the air brake pipe which operates brakes on the trailers, and two cables and couplers for connecting up the trailer motors to the resistances and controller.

Traffic Operation.

On the direct Nimes to Pont-du-Gard route of 15½ miles, there are five passenger services a day in each direction, taking 1 hour 15 minutes on the journey, and one mixed service for passengers and heavy goods on trailers, taking 2½ hours. On the triangular route there are four through passenger services daily in each direction, taking 2 hours 10 minutes for the 21¾ miles, and 3½ hours for the mixed service. Of the villages served, five have a population of between 1,200 and 2,000, and two villages have 2,000 and 2,500 inhabitants. Agricultural produce is carried to Nimes; some goods depôts are arranged along the two routes.

The speed attained exceeds 30 km. an hour (18.6 miles) in the case of passenger traffic, and 20 km. (12.5 miles) an hour in the case of the mixed service. Those 'buses which have been in service since June, 1924, have averaged 30,000 km. (18,600 miles) per vehicle, while those set to work in November last year and February this year have averaged 20,000 km. (12,400 miles) and 10,000 km. (6,200 miles) respectively.

This system, with its simple overhead equipment supported on wood poles, its simple automatically-operated sub-stations, the absence of expensive feeders, and its service of parcels and heavy goods, is an example of what can be done at a reasonable capital cost when an effort is made to provide an installation which the revenue limits of a local, mainly agricultural, traffic, can allow for.

The design of the electrical apparatus was studied in France to suit operating conditions, the 'bus motors and controllers being constructed at Vénissieux, near Lyons; the chassis and the mechanical parts were designed and constructed at Tarbes in collaboration with the Railless Co.

The writer is indebted to the Constructions Electriques de France, of Paris, the contractors, for the technical details and photos of this interesting French installation.

The Electrical Measurement of Altitude.—A new instrument which measures altitude electrically, and about eight times as accurately as the ordinary barometer, to a height of at least one mile, has been constructed by the French physicists, Drs. Huguenard, Magnan and Planiol, and was recently shown before the French Academy of Sciences. The apparatus is based on the fact that a heated object cools off much more quickly in dense air than in very thin air or "near-vacuum," because in a near-vacuum there is very little matter to conduct or convey the heat away. The density of air depends on the altitude, so that an instrument that will measure air density will also give a measure of the altitude.

The device consists of a wire of great resistance, so that when an electric current is passed through it, a high temperature can be attained. Heat is immediately lost by radiation, convection currents in the air, and to a certain extent by conduction. After each of these leaks has done what it can, the temperature of the wire has reached equilibrium; and when once this balance is attained, changes in the temperature of the wire will be due to changes in the density of the surrounding air.

The electrical resistance of the wire changes with the temperature; a variation in the density of the air will therefore cause a variation in the intensity of the electric current, and this fluctuation can be used to measure the altitude, since the density varies according to the distance above sea level.—*Science Service.*

German Goods with an English Trade Mark.—During the hearing of an action in the Shoreditch County Court, on December 9th, before Judge Cluer, it was mentioned by Mr. Armstrong, counsel appearing in the action, which was to recover the price of a number of vulcanite syringes supplied, that the goods were ordered in February, but were not actually delivered until October, this being because they had to come from the Continent, and when they arrived on the first occasion there was a good deal of trouble with the Customs, as it was found that the goods were stamped with the defendant firm's English trade mark, and in consequence they had to be returned for the trade mark to be erased. Judge Cluer said that he was pleased to hear that the Customs Authorities were wide awake, and he hoped they always would be to prevent such a thing happening. Counsel had euphemistically called these "Continental" goods, but they were German goods and certainly should not bear an English trade mark.

Electricity Supply at Bexley Heath.

The New Sub-station of the Bexley Council Electricity and Tramways Department.

A good example of some of the installations which are being put down to deal with bulk supplies is found in the new sub-station of the Bexley Council Electricity and Tramways Department and the Dartford Light Railways. A decision to scrap the old Bexley generating station and to take a bulk supply from the Woolwich Borough Council generating station culminated in the change-over of the Bexley Heath supply to the new sub-station in July last.

Fig. 1.—2,000-V Board.

The supply from Woolwich is received at 10,000 V, 3-phase, 50 cycles, by two 0.15 sq. in. 3-core, 33,000-V cables, provision being made for a possible increase in the transmission pressure by the Woolwich Council in the future. An eight-panel switchboard deals with the e.h.p. supply, two central panels being provided for the incoming cables. Two panels each feed a 700-kVA transformer bank for a.c. distribution, and two others feed two 380-kVA transformers supplying two rotary converters for the d.c. traction supply. A spare panel is intended for a 1,500-kVA transformer bank to be installed later, while the remaining panel provides cubicle accommodation for the potential transformers of the switchboard instruments. The transformer banks are Scott-connected with their secondaries supplying two-phase, 2,000-V (phase and neutral) to a 2,000-V distribution board, fig. 1. Each phase is dealt with separately by this board, and is fed into the single-phase, 2,000-V system of the undertaking, the network being split to accommodate the two phases. Seven panels are provided, two for the incoming feeds from the transformer banks, four feeder panels, and one spare for the future bank. Each panel is equipped with two s.p. breakers, one on each phase, and accommodates two circuits, separate phases, feeding to or from independent busbars. Both the 10,000-V and the 2,000-V boards are of steel construction, with steel-plate panels and cubicles. The 380-kVA transformers at the back of fig. 2, each reduce the supply to the converters from 10,000 V to 375 V. The rotaries, fig. 2, which were installed by the British Electric Plant Co., Ltd., are each of 300-kW capacity and provided with a direct-coupled pony motor for starting. A two-panel starting board, fig. 2, centre, equipped with the necessary main switches, field reversing switches, and lamp synchronising gear, is provided for these machines. The traction board, fig. 2, right-front, is of the open type with polished slate panels, two for the converters, three feeder panels, and one B.O.T. panel equipped with the usual rail leakage apparatus, &c.

A 150-kVA local transformer fed from the 2,000-V board supplies a l.p., 4-panel board of a similar type to that of the d.c. board, during periods of heavy load. The l.p. network is permanently looped through two panels of this switchboard, the other two panels providing for the feed from the transformer and the station lighting. The l.p. system is three-wire, 400 and 200 V, and is served by 14 transforming kiosks.

A booster transformer made by the Hackbridge Cable Co. is the only piece of apparatus brought from the original generating station. It is used as a negative booster on the bulk supply at 2,000 V to the Foot's Cray Electric Supply Co., situated about four miles away.

The building, 60 ft. by 35 ft., is of brick and steel construction, glazed brick inside, with a reinforced glass and wood roof. A 5-ton "Morris" hand crane serves the machine room. A small room is set apart as a workshop and testing house, and another, equipped with electric cooking apparatus, accommodates the staff. The premises were built by Messrs. J. W. Ellingham, Dartford, under Mr. J. Cowper, architect. The e.h.p. transmission cables from Woolwich were supplied and laid by The Pirelli-General Cable Works, Ltd. The switchboards were installed by Messrs. Johnson and Phillips, Ltd., who were entrusted with all the cabling inside the station. The switchboard instruments were supplied by Messrs. Johnson & Phillips, Everett Edgcumbe & Co., and Ferranti, and the transformers, other than the booster, are of the Swedish General Electric Co.'s make. The lay-out and specifications for the station were prepared by Mr. A. J. Abraham, the engineer and general manager, to whom we are indebted for assistance in the preparation of this article.

D

The Combustion Engineer.

His Training and Duties in Electrical Power Stations.

By CHAS. F. WADE, A.M.I.Mech.E., A.M.I.E.E.

The fact that the highest thermal efficiency in steam raising units is to be found among the boiler plant supplying steam for electricity supply undertakings seems to be responsible for a curious fact that has been commented upon by various outside persons in conversation with the writer, who has observed the same thing personally. What is referred to is a very prevalent impression in a man's mind that because he is either in superior authority, or is on the generating staff of an electricity undertaking, he is, as a natural sequence, an expert on matters pertaining to fuel economy.

As a case in point may be cited the engineer who, after his new boiler house had been held at half working pressure for a week or so after lighting up, suggested quite seriously that the pairs of boilers were now ready to be coupled in series in readiness to work at full pressure! Another instance of appreciation of boiler-house problems is the objection a certain engineer has to turbine pumps owing to their constant speed. Again, take the case of a new battery of water-tube boilers whose exit flues are connected to an existing natural-draught stack; the stokers are fitted with balanced-draught fans, but these are not used, as the engineer considers the natural draught is sufficient and he does not for an instant realise the inefficiency and cost of chimney draught. Perhaps one other instance will suffice, and that is of an engineer who, in his own words, "will not give anyone best on boiler work," and who holds that scale in boiler tubes does not interfere with heat transmission, as, when at work, the scale is permeated with water and thus allows direct contact between the hot tube surface and the water. A very eminent power supply engineer some little while ago expressed an opinion to the effect that boiler-house control instruments were of little use, as an accurate return of water evaporated per pound of coal was all that it was necessary to know.

It is true that the highest efficiencies at the present day are to be found in modern power stations and, where not due to new plant embodying the latest advances in efficient heat transfer which has not had sufficient time to deteriorate appreciably, this high efficiency is almost entirely due to the unremitting control and careful supervision of a specially qualified expert.

The separate branch of the engineering profession known as "combustion engineering" is of comparatively recent origin, and in view of this some vagueness as to its definite scope and requirements of training and knowledge is perhaps, to a certain extent, pardonable; this lack of appreciation is frequently reflected in the scale of emoluments offered in connection with vacancies for such positions. In some stations a highly trained fuel chemist is given the duty of supervising the efficient operation of the boiler plant, but the knowledge and training needed call for more than a good training in chemistry, and the writer would be inclined to favour an enginer with an aptitude for chemistry in preference to a chemist with engineering leanings. Although a thorough appreciation and understanding of chemical principles is needed for the successful combustion engineer, a very wide knowledge of this subject is not called for; probably a more extensive knowledge of heat-physics is needed than of chemistry, together with the physical properties of materials under the influence of high temperature.

That the boiler-house superintendent should be an engineer to begin with is essential in view of the fact that practical limitations are met with in many directions, and such are almost always of an engineering nature, where they do not consist of questions of financial expediency. The latter again show the necessity for some financial or business capacity so that the feasibility or otherwise of any proposition can be reduced to reliable values in £ s. d.

The control and handling of a boiler-house staff require some knowledge of psychology in order to impart knowledge to, and to get the desired results from, men of widely varying temperament.

It is but rarely that a specialist starts his training as such, but he develops his special aptitude during the course of duties and work of which the subject in which he specialises eventually is but a section. A young generally-trained shift engineer will find some portion or other of his duties in the station appeal to him more strongly than others, and will thus tend to devote most of his attention to that branch of his work which tends to attract him most; this is the usual beginning of a combustion engineer as a specialist, and chiefs would be well advised to look out for such tendencies and to encourage them so far as is possible, in their own interest.

As to the special scientific training required to qualify him for a responsible combustion-engineering post, a shift engineer is somewhat under a disadvantage owing to the interruption to continued spare-time attendance at technical classes involved in the change round of his duties. As already mentioned, the chief would do well to encourage the keen combustion man and therefore to single him out for day-time work only on duties connected with the boiler house, fuel analysis, &c. This does not apply, of course, to places where there is no technical instruction locally available, and in these instances the aspirant will have to do the best he can with books and perhaps correspondence tuition. The latter, particularly if taken as an adjunct to everyday work, should be especially valuable. Actual combustion engineering courses are not, as yet, very widely available in the technical colleges, though they may be obtained at the Northampton Engineering College (Clerkenwell), Leeds University, and Swansea University College, among others.

If the preliminary training has been of the usual practical and technical order, including the customary heat-engine courses, the principal additional instruction needed will consist of a certain amount of chemistry and physics, while the necessary mathematical knowledge is not at all formidable as it does not extend beyond the limits of simple arithmetic, and practically all calculations are readily worked out with an ordinary 10-in. slide rule.

The chemical knowledge called for in a combustion engineer, as distinct from a fuel technologist, will be amply provided by a course of elementary inorganic chemistry, to give the proper understanding of chemical principles and laws, together with some instruction in the earlier portions of organic chemistry, especially as it affects the simpler hydrocarbons and carbohydrates. As the duties of the combustion engineer usually include the examination and treatment of feed water, some extra attention must be given to the properties of water and its impurities, solid and otherwise. In the chemistry course the student should acquire some knowledge of the methods of qualitative analysis in order to be in a position to appreciate questions of ultimate analysis of fuel and the analysis of feed water, but such work should not form a part of the regular duties of the post under consideration, being the province of the specially trained analytical chemist; as such it would occupy too large a proportion of the working day, to the exclusion of the practical application of such investigations.

The training in heat physics should be as complete as possible, especial emphasis being laid upon the all-important principles and laws of the transmission of heat by various means, such as radiation, conduction, and convection; influence of surfaces on the absorption and

dissipation of heat; influence of gas velocities on heat transfer; laws of gases, and so on.

As regards psychology, with some individuals this appears to be a gift, but in the majority of cases this rather abstract quality is developed in a person by careful attention to and study of the mental idiosyncrasies of the various persons under his supervision. Coupled with psychology may be mentioned tact, and it is difficult to draw a clear line of demarcation between the two qualities. If reliance is placed merely upon the autocratic attitude of "do as you are told or get out" it is a foregone conclusion that the whole of the employés will get into a habit of working like unthinking machines, merely carrying out the letter of their instructions and no more. With a raw staff who have not previously been accustomed to working for high efficiency, this will no doubt be effective up to a point in improving matters, and also up to the same point the "company sergeant major" attitude will probably prove of value in forcibly demonstrating to the men that their boss knows what he is talking about by the improvement in results obtained. To obtain the highest practical efficiency of which a boiler plant is capable will call for intelligent appreciation by the working staff of the reasons why certain methods of operation lead to improved results, and it is up to the combustion engineer to foster this state of mind. To be successful, therefore, calls for careful study of the men concerned, and imparting the required knowledge and interest in the manner most suitable for the individual.

We now come to the business or financial side of the question. A fully qualified combustion engineer must not only be able to get the highest possible efficiency from the plant for which he is responsible, but must also be able readily to calculate the ultimate financial result of improved methods, in view of the well-known fact that over a given point thermal efficiency and commercial economy cease to be the same, and that further improvements cost more to obtain than the value of the saving to be effected. Similarly, he must be able to weigh carefully and accurately the possibilities of new plant and accessories brought down to the ultimate question of net money saving. This calls for full consideration of money-earning value of space occupied, standing charges for depreciation, maintenance, and interest on capital, labour and power charges, and so on, all to be set against the gross economies to be effected by the changes contemplated.

Above all, the successful combustion engineer must keep an open mind with regard to modern advances, and not be prone to condemn or to approve of any plant or apparatus without due thought and consideration. He must also keep abreast of the times, and as it is a physical impossibility for any one man to have practical working acquaintance with each and every type of plant and accessory in existence, he must give full study to the permanent and periodical literature relating to his particular sphere of activity. As regards periodical literature specialising in combustion work, about 50s. per annum would cover subscriptions for the whole of it, including one very valuable publication produced in America.

Coming now to the scope of the combustion engineer's duties, this will be governed to a large extent by the size of the plant under his control. In the smaller stations he will obviously have to carry out a large portion of the practical detail work personally, while in the large stations he will be at the head of a staff of assistants, the most important of these being the boiler-house shift engineers and the chemist. His position must be such that he is responsible directly to the chief engineer without the intervention of any intermediaries whatever. This often makes a new man's position somewhat uncomfortable for a time, as it is perhaps a matter of human nature that men of comparatively long service with an undertaking will feel some resentment at a newcomer being appointed to a post carrying a higher salary than their own. The obvious remedy for these longer-service men is not to waste their time grumbling, but to do their best to qualify themselves for a similar job. Incidentally, one wonders whether the somewhat inadequate salaries usually offered for combustion engineers are due to the chief's disinclination to upset his existing staff.

Coming back to the question of scope of duties, this cannot be better described than everything connected with the fuel from its initial selection and purchase, the economical and efficient extraction of the utmost percentage of its potential heat, to the final rejection of the ashes and waste gases. The main line and ramifications of the subject are enormous, and are extending daily.

The best of workmen cannot work without tools, and if a man is offered the position of combustion engineer, before definitely taking up the post, he must insist that he shall have a free hand in the selection and installation of the necessary instruments and other indispensable apparatus. It is true that in many stations to-day the application of what the writer terms "scientific rule of thumb," or improvements in operation based upon scientific knowledge without the aid of instruments, will go a very long way in reducing fuel costs, but even the improvement thus obtained will not satisfactorily approximate to the degree of efficiency consistent with present-day possibilities.

It is impossible to ignore the fact that in all considerations of professional career and position the question of remuneration is a very important one. The writer is aware that the supply of really qualified combustion engineers in this country is very limited, many applications for such posts being from shift engineers who are employed in highly efficient modern stations, but who are unable to produce any evidence that they themselves are in any way responsible for the good results. There are, no doubt, many such engineers who propose to get the job first and then to qualify themselves for it as time goes on; while inadequate salaries are the rule, this is the only type of man the advertiser has a right to expect, and he will merely make his boiler house a sort of training ground for men who wish for an opportunity to devote the whole of their time to the study of combustion, so as to qualify themselves eventually for a better post elsewhere.

The grading of a chief combustion engineer should never be below Grade 3 on the N.J.B. Schedule, while qualified shift engineers or assistants should in every case be graded about Grade 5 when engaged solely on boiler house and fuel economy work. The writer considers that while Grade 1 applies to deputy chief officials, Grade 2 should be allocated to the superintendent combustion engineer. This certainly appears to be the correct state of affairs in view of the predominating importance of the combustion department in modern power generation.

International Agreements.—In the course of his speech at the annual meeting of Dorman, Long & Co., Ltd., the chairman, Sir Arthur Dorman, said that there was a probability that the iron and steel trades' application for protection would be rejected and that they would have to go on fighting unaided. He attributed the bulk of the evils under which we were labouring to lack of demand and the disparity between conditions in this country and on the Continent. The real remedy for these evils was an understanding with Continental producers which would be of advantage to both parties, and much more effective than any purely internal agreements. Sir Arthur concluded in an optimistic vein. He said that we were not far from turning the corner; we were nearing the end of the post-war depression.

The Shannon Scheme Dispute.—Mr. McGilligan, the Irish Free State Minister for Industry and Commerce, stated in Dail Eireann last week that work upon the Shannon scheme was proceeding. Over 900 men were working, including about 140 Germans. He contended that the men were satisfied with their conditions, in spite of the statements of trade-union leaders.

Australian Production and Imports.—In last week's *Board of Trade Journal* was published a comparative statement of the imports of various classes of goods into Australia, and the production of such goods in the Commonwealth, in the year 1923-24, the latest period for which figures are available. The table shows that imports of electrical apparatus were valued at £4,865,975, while the value of the home production was £1,233,317.

The Electrification of Textile Mills.

Some Important Contracts.

Several important and interesting contracts for electric driving and direct-geared turbine driving of textile mills, both at home and abroad, are being executed by the Metropolitan-Vickers Electrical Co., Ltd.

Work in hand for Messrs. J. & J. Hayes, of Leigh, Lancashire, covers the complete electrification of the greater part of the Victoria Mills, the installation having been laid out by Mr. A. B. Mallinson, consulting engineer. The equipment includes a 2,000-kW, 3-phase, 2,200-volt, 3,000-r.p.m. steam turbine generating set, motors totalling about 3,000 h.p. with control gear, sheet-steel cubicle-type switchgear, and a step-down transformer for lighting purposes. Interesting features of this installation are the closed-circuit ventilation system

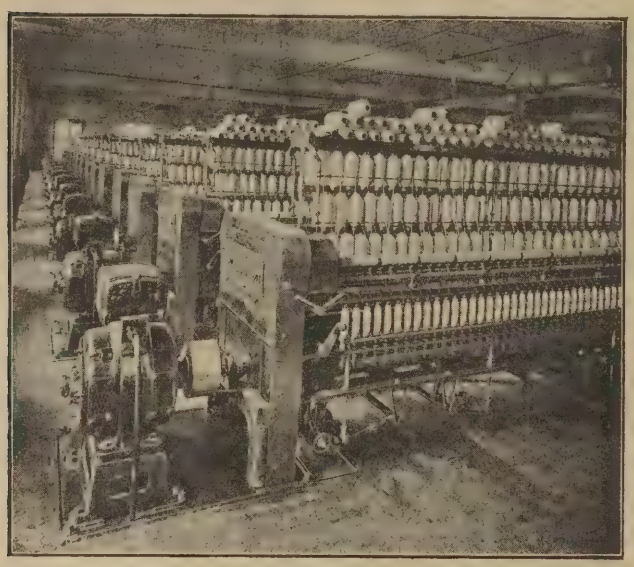

Fig. 1.—Ring Spinning Mill driven by M.-V. Motors.

to be used for the alternator, the use of a voltage regulator, and the employment of squirrel-cage motors arranged normally to start and run up to speed with the generating plant.

Electrical equipment is in hand for three mills at Preston of Messrs. John Hawkins & Sons, including motors totalling over 3,500 h.p., with liquid controllers and ironclad control pillars, and a separate main switchboard for each of the three mills.

Fig. 2.—Motors for Ring Frame Drives in a Brazilian Mill.

For the Rishton mill of Messrs. O. & J. Folds, Ltd., of Burnley, motors totalling about 500 h.p. are being supplied, together with liquid controllers and ironclad control pillars.

Equipment is now being installed at the important bleach and dye works of Messrs. John Welch & Sons at Chinley, which includes two generators of 250 kW and 50 kW, respectively, motors totalling about 400 h.p. with the necessary control gear, and also a complete main switchboard.

The illustration, fig. 1, shows a ring spinning electrical drive at the Empire Spinning Company's mills in Oldham. Twenty such equipments were supplied in 1922, 16 duplicate sets in 1924, and 20 additional sets are being completed now, all the equipments being ordered through Mr. Robert Blackmore as consulting engineer.

The Metropolitan-Vickers export textile equipment contracts are mostly for Brazil and India. In fig. 2 are shown motors for ring frame drives, forming part of an order for a new mill at Sao Paulo; this contract includes motors totalling 730 h.p., and transformers totalling 2,100 kVA capacity. Other contracts for Brazil include motors totalling over 1,200 h.p., for use in eight different mills. A number of these motors are for the Cia Fiacao Mill at Pirassununga, where already M.V. Co. motors totalling over 1,500 h.p. have been installed.

For India interesting contracts now in hand include three geared turbine sets, with condensers, for the direct mechanical drive of the mills. These contracts include turbines of 1,000 h.p. in two instances, and one of 4,500 h.p.; the latter, we are informed, represents about the largest output by the direct drive for which so far a steam turbine has been installed.

Extensions at Maidstone.—On Saturday last recent extensions to the plant and buildings of the Corporation Electricity Works, Maidstone, were officially inaugurated by Mr. J. Hillier French, past chairman of the Electricity Committee. The main extensions consist of a 3,000-kW Brush-Ljungström turbo-alternator and two Vickers-Spearing boilers each of 30,000 lb. per hour capacity, with the necessary switchgear and auxiliary plant, contained in an entirely new ferro-concrete building, turbine and switch room and boiler house. The station now has a total capacity of 8,575 kW. At an inaugural luncheon which followed the opening ceremony, Mr. S. P. Sanders, vice-chairman of the Electricity Committee, presided in the absence of the chairman, Mr. W. H. Martin, who was indisposed. After the loyal toast, Mr. French, in proposing "The Maidstone Electricity Supply Undertaking," paid a tribute to the borough electrical engineer, Mr. E. E. Hoadley, M.I.E.E., referring to the designing of the new extensions and to the management of the undertaking in general. In Mr. Hoadley, he said, the Corporation had an engineer who was a keen business man. The combination of the two qualifications was essential in the management of modern undertakings. Mr. Sanders in reply read a letter from the chairman reviewing the progress of the undertaking from its commencement 24 years ago. Mr. Hoadley also replied and referred to the happy position of the concern which he controlled with regard to its industrial load. The load factor of the station would this year exceed 43 per cent. In reply to "The Visitors" by Councillor F. R. Connor, Mr. J. Andrew Lee, technical adviser to the Electricity Commissioners, conveyed the congratulations of Sir John Snell to the Corporation and its electrical engineer on the broad-mindedness shown in extending the distributing mains to the areas surrounding Maidstone. Mr. Lee said that the Electricity Commissioners would like to see other supply engineers following the example of Mr. Hoadley in paying unofficial visits to them when any important question could be discussed with advantage. The Commissioners could not make progress without the co-operation of the supply undertakers, and too many of the latter took a too parochial view with regard to their undertakings. The industry as a whole was making headway, costs were coming down, and the thermal efficiencies and the loadings were improving. Mr. J. W. Beauchamp, director of the Electrical Development Association, also replied. He congratulated the Electricity Department on having the high consumption figure of 400 kWh per head of population. Engineers generally did not plan plant extensions with sufficient generosity. He thought there would be inconvenience in many places by Christmas, 1927, when the plant available would be inadequate for the ever-increasing demands. Maidstone was an important industrial centre as well as a town of agricultural importance situated in a beautiful country district. This curious mixture, he thought, might prove the solution of a modern problem in electricity supply in the "better world to come."

New Berlin Generating Station.—According to *Power* a new municipal generating station is being built in Berlin on the bank of the Spree River at Rummelsburg, which is to have an ultimate capacity of between 500,000 and 600,000 kW. The first section will be equipped with 16 boilers, each with a heating surface of about 19,000 sq. ft., and fired by pulverised fuel, three 70,000-kW twin-tandem compound turbines, and three 10,000-kW bleeder turbines for stage feed-water heating.

The Electrical Trade Section at the Birmingham Fair.

Progress of the Movement.

WE are pleased to learn that electrical firms are making a very gratifying response to the invitation to make small exhibits in the Electrical Trade Section of the British Industries Fair at Birmingham from February 15th to 26th.

Our anticipations that the importance of making an effective representation of British electrical products would be appreciated by manufacturers when the matter was properly brought before them, have already been fulfilled. The attention that we devoted to the subject in our issues of November 20th and December 4th, and the emphatic way in which we stressed the need for action, have been fully justified.

Shortly after the meeting held at the Birmingham Chamber of Commerce, the provisional electrical committee met, some leading electrical representatives who had been unable to attend at the first meeting being present. As a result of deliberations on this occasion it was decided to ask Mr. W. A. Gillott (who did such excellent work for the industry in the E.D.A. corner at Wembley) to proceed to secure exhibitors to fill the space that was known to be available in one of the large buildings at Castle Bromwich. In the course of a few days many spaces had been allotted and many more may be booked before this issue of our journal reaches the readers' hands.

Down to the end of last week a considerable number of firms producing various kinds of electrical goods had definitely taken space. We would impress upon others the necessity for making up their minds promptly so that the management and committee may get forward with the final organising arrangements. It is possible to have a sample counter display for an inclusive cost of £10, or a small stand (made with hired material) for an inclusive cost of £16 or £17. Forms showing such stands and giving all details can be obtained from the General Manager, British Industries Fair, 95, New Street, Birmingham.

In the Hall containing the Electrical Trade exhibits it is proposed to erect a booth of considerable size where visiting Association delegates can meet, confer, and dine together.

As should be well known by this time, a very large number of postal invitations have been issued by the Board of Trade to potential buyers in the Colonies and in foreign countries. By means of advertisement announcements in newspapers and trade papers published overseas, other invitations have been issued to an even larger body. To all of these who read the ELECTRICAL REVIEW, and to any of our special audience who have not received or seen such invitations, we are able to give a definite assurance that at Birmingham there will be a large group of representative British electrical exhibits, which together with the other features of the great British Industries Fair both in Birmingham and in London, will make a visit during the twelve days well worth while. We understand that British wireless trade products will be displayed at the London end of the Fair—at the White City.

We trust that immediately after the Christmas vacation, steps will be taken to secure the presence at Birmingham at some time or other during the run of the Fair of merchants interested in export trade, of architects, hardware men, ironmongers, and departmental managers of the great stores in different parts of the country.

Electrical retailers and factors from all points of the compass should make an endeavour to spend a day there, as a trade event of this character should possess particular value for them.

It is mainly upon the presence of the right class of visitors from at home and abroad that the success of the 1926 exhibition depends; and upon the 1926 result depend the continuance and development of the Electrical Section of the Fair in subsequent years.

The following are included in the list of electrical exhibitors:—

Sturge & Baker, Ltd.
Falkirk Iron Co., Ltd.
Tucker, J. H., & Co., Ltd.
Relay Automatic Telephone Co., Ltd.
Electricars, Ltd.
Mouldensite, Ltd.
Manda Motors, Ltd.
London Elec. Wire Co. and Smiths, Ltd.
Reeves & Co.
Magnetic Separators, Ltd.
McGeoch, Wm., & Co., Ltd.
British Elec. Repairs, Ltd.
Commutator Grinding Block Co., Ltd.
Sheringham Daylight Co.
Rapid Magnetting Machine Co.
Tok Switches, Ltd.
Waygood-Otis, Ltd.
Chloride Electrical Storage Co., Ltd.
Higgs Motors.
Siluminite Insulator Co., Ltd.
Canning, W., & Co., Ltd.
Premier Elec. Heaters, Ltd.
Nobbs, Geo., Ltd.
Imperial Engineering Co.
Coley & Swinnerton, Ltd.
Jackson Elec. Stove Co., Ltd.
General Electric Co., Ltd.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index to Vol. XCVII (for the half-year ending December 31st, 1925) will be published shortly, and we shall be glad to receive the names and addresses of those who require it (free of charge) for binding purposes or wish to retain it for reference. Application should be made as early as possible to the Publisher, 4, Ludgate Hill, E.C.4.

The Timber Trade. — Our timber trade correspondent reports that the market for general construction woods, imported from the north of Europe, has now got over its difficulties of late summer, when prices for forward delivery from shipping ports were low, with keen selling competition and poor values also in this country. The imports in both October and November showed a decline compared with the corresponding periods of 1924, and with an early closing of navigation there is not much more timber to come forward from northern Europe this season. Although stocks are large the consumption continues very good, and prices have become much firmer. In the hardwood section of the trade teak and mahogany are firm, as are also oak, ash, walnut, &c. The supplies from America are improving in value as shippers in that country are very firm in their ideas of the market. This has a great influence on spot prices, but it also has the effect of making wood consumers look more towards British hardwoods, the better qualities of which are second to none in the world.

Correction.—We regret that in a Catalogue Notice in our issue of December 18th we made mention of the "Ray Engineering Co., Ltd." The concern is owned solely by Mr. R. C. Carter and "limited" should not have appeared.

Lead. — In their report dated December 19th, Messrs. James Forster & Co. stated:—"There was a better tone about the market this week, and although consumers have not been active, a certain amount of buying has been seen. This, and sympathy with other metal markets, was sufficient to lift the prompt price of lead nearly 20s. per ton from the lowest prices touched. There is still no lack of prompt lead, which is generally the case about this time of the year. The future course of prices depends largely on whether consumption revives in this country and in Germany over the turn of the New Year. Consumers have shown very little interest during the past month or six weeks and, it may be, will have to enter the market after the holidays for supplies, with a consequent further recovery in values. On the other hand, if present conditions continue into next year, prices will probably fall away to a still lower level."

New French Company.—La Société d'Electrification de la Region de Bourbon-Lancy is the name of a new company which has lately been organised at Moulins with a capital of 1,600,000 fr. to establish an electricity distribution system in that district.

The British Industries Fair.—In order to relieve apprehensions which have arisen, the Birmingham Chamber of Commerce has issued a circular definitely stating that no retail selling will be permitted at the Birmingham section of the Fair. At the London Fair retail sales will be confined to "tasting samples" in the food and Empire sections.

Hackney Electricity Staff Club.—There has been established in connection with the Hackney Electricity Department the "Hackney Electricity Staff Club." Its objects are to provide catering facilities, social functions and recreative and educational opportunities for the staff of the undertaking. For five days a week members of the staff are served with an excellent lunch, cooked electrically, at an extremely moderate figure, the meal being prepared in an electric kitchen adjoining the club dining room. We had an opportunity last week of inspecting the club arrangements at the magnificent Demonstration Hall and Showrooms at 18-24, Lower Clapton Road, and found them to be all that one could desire. By the way, we would parenthetically recommend borough and other supply engineers and commercial managers to take an early opportunity of visiting the Hackney Hall, as all the notes and illustrations published in the Press have failed to do it full justice because the true idea of space and coloured illumination effects cannot be conveyed by prosaic newspaper printing. Mr. L. L. Robinson is president of the club, with Mr. J. R. Bowden as vice-president, and Mr. D. C. Clark as hon. secretary. Members pay a subscription of 1s. per month or 10s. per year, and they are entitled to bring visitors. The affairs of the club are in the hands of a management committee.

Trade Announcements.—The address of OERLIKON, LTD., is now Oerlikon House, 28-31, Essex Street, Strand, W.C.2. Telephone: City 3421 and 3422; telegraphic address: "Oerlik, Estrand, London."

MESSRS. JESSOP BROS., electrical engineers, have opened premises at the Reliance Works, 17, Beast Market, Huddersfield.

MR. LAWRENCE CHARLTON has taken over the business of Messrs. Sleigh & Wood (Pilgrim Street, Newcastle-on-Tyne), recently carried on by the late Mr. Lionel Wood. Mr. Charlton has been manager for a number of years. All debts prior to his taking over (September 12th, 1925) will be attended to by the administrator of the estate, Mr. Adamson Rhagg, 18, Clayton Street, Newcastle-on-Tyne.

THE ENFIELD CABLE WORKS, LTD., has just opened a depôt at 14, Marble Street, Manchester, for the sale of its rubber-insulated wires, cables, flexibles, &c., of which large stocks are held there.

The London address of MESSRS. SANDERSON, MURRAY AND ELDER, LTD. (buyers for Messrs. Turnbull & Jones, Ltd., of New Zealand, and for Messrs. W. G. Watson & Co., Ltd., of Australia), is now 47, Gresham Street, E.C.2, where they will be pleased to see representatives of electrical firms.

The LONDON MAGNETO REPAIRING & WINDING CO., LTD., of 78, Hampstead Road, London, N.W., has been appointed a service depôt for horns and other products of the E.A. Laboratories Inc., Brooklyn.

Catalogues and Lists.—MESSRS. GEORGE COHEN, SONS AND CO., LTD., 600, Commercial Road, E.14.—A comprehensive descriptive list of machinery and plant (new and second-hand) for sale. Also pamphlets dealing with inspection trolleys, gas, steam and water fittings, &c.

MESSRS. J. HOPKINSON & CO., LTD., Britannia Works, Huddersfield.—List No. 1860, advertising the company's draught gauges. Illustrated.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—Two showcards in colours advertising the company's "Velvact" potentiometers and variable resistances.

THE BRITISH B.A.G., LTD., Orme Buildings, Parsonage, Manchester.—A showcard advertising the "Lomax" lampholder, from which screws are absent.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—"The Benjamin Reflector" for Christmas, suggesting a number of seasonable gifts.

"MANDA" MOTORS, LTD., 53-54, Royal Mint Street, E.1.—A price list of electric fans and small power motors.

THE CONTRACTORS' SUPPLIES CO., 5, Finsbury Square, E.C.2—A price list of electrical materials and accessories.

HIGGS MOTORS, Witton, Birmingham.—A priced stock list of a.c. motors and d.c. dynamos and motors.

CARRON COMPANY, Carron, Stirlingshire.—A well-illustrated catalogue of the company's heavy cooking apparatus for employment in restaurants and institutions, and on board ship. The list includes electric baking ovens.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A mailing card advertising the "Magnet" pedestal heater, toaster, iron and kettle. Priced.

MESSRS. GEORGE NOBBS, LTD., 87-89, Cleveland Street, Fitzroy Square, W.1.—Catalogue Sections Nos. 215 and 216, dealing respectively with "Genii" safety electric geysers, and electric urns and water boilers. Illustrated and priced. Also a print of a completely fitted bathroom in miniature.

MESSRS. EVERSHED & VIGNOLES, LTD., Acton Lane Works, Chiswick, W.4.—An illustrated brochure describing the "Meg" insulation tester; and a descriptive list of the company's recorders for various applications.

THE RANSOMES & MARLES BEARING CO., LTD., Newark-on-Trent.—A booklet containing illustrations, prices, &c., of ball and roller bearings.

MESSRS. E. BENNIS & CO., LTD., 28, Victoria Street, S.W.1.—An illustrated brochure dealing with the company's stoker and self-cleaning furnace.

MESSRS. T. BEADLE & CO., LTD., 3, Castle Street, Hull.—A comprehensive illustrated and priced catalogue of radio apparatus of all kinds.

MESSRS. PHILLIPS & TURNER, Cambridge Street, Birmingham.—Illustrated leaflets advertising lanterns, lamp canopies, ceiling plates, brackets and other lighting fittings.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—Publications Nos. 396a, the "Primax" loud speaker; 439, the "Mellovox" loud speaker; and 440, the "Miniloss" square-law condenser. Illustrated and priced.

Bankruptcy Proceedings.—F. A. FRASER, electrical engineer, 33, Tothill Street, Westminster.—An application for an order of discharge was made recently to Mr. Registrar Francke at the London Bankruptcy Court on behalf of this debtor, who failed last June with ranking liabilities of £3,020 and no realisable assets. The Official Receiver reported that since 1909 the bankrupt had acted as director of a number of limited companies, including the Electrical Contracts & Maintenance Co., Ltd., which went into liquidation in 1924, and was succeeded by the Electrical Contracts & Maintenance Co. (1925), Ltd. He attributed his failure to the insolvency of the old company and his liability as guarantor on its behalf. The application was opposed on the grounds (1) insufficiency of assets to equal 10s. in the £ on the amount of the liabilities, and (2) contracting debts provable in bankruptcy without having reasonable or probable ground of expectation of being able to pay them. His Honour suspended the discharge for two years.

JAMES WILSON, electrical engineer, 70, Ebrington Street, Plymouth.—This debtor appeared for his public examination at Plymouth on December 18th. Examined by the Official Receiver, he stated that after working as a journeyman in different parts of the country he fell out of work, so he started in business on his own account, without capital, and, later, commenced a partnership with another man, who provided £200 capital. After three months the partnership was dissolved, debtor paying £50 in settlement and taking over the liabilities of the business. He moved to his present address but found the rental a heavy burden. Pressed by various firms he executed a deed of assignment in October, 1923. At that time his liabilities were stated as £448, but the list was incomplete. The assets amounted to £388. He started again in business after paying a dividend of 6s. 8d. in the pound. He made a good living until the beginning of 1925, when he fell ill and was unable to give proper attention to the business. The examination was closed.

E. O. HENSTOCK, 21, Old Road, Brampton, Chesterfield, Derbyshire, electrical engineer and wireless dealer.—The first meeting of creditors was held on December 18th at the Official Receiver's offices, Nottingham. According to the statement of affairs, there was a deficiency of £259. Debtor attributed his failure to competition in the radio trade and the illness of his family. He commenced business on his own account in October, 1922. Subsequently he entered into partnership with another, but this was dissolved. In September, 1924, he started dealing in radio goods, but the business was a failure, and he became aware of his position in the following March. There was not a quorum of creditors present at the meeting, and the matter was left with the Official Receiver as trustee of the estate.

G. J. C. THORNE and A. H. THORNE (Lawrence Electrical Trading Co.), electrical engineer, late of 159, High Street, Notting Hill Gate, W.—Last day for proofs for dividend, December 31st. Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C.

W. G. BAYMAN, electrical engineer, late of 13, Russell Street, Plymouth.—Application for discharge to be heard January 11th, at the Court House, Wandsworth, S.W.

Company Liquidations.—MORCH BROS., LTD., radio instrument manufacturers, 35, Tresham Avenue, Clapton, E.—The accounts filed under this compulsory liquidation show liabilities of £1,327, assets valued at £453, and a total deficiency of £1,874 as regards contributories. Mr. E. T. A. Phillips, Official Receiver, reports that the company was formed in December, 1924, by Jacob Johannus Morch, for the purpose of carrying on the business of motor engineers and manufacturers of radio instruments and appliances. Morch stated that the motor business carried on by him and his brother was not a marked success; in the autumn of 1923 they commenced to manufacture radio sets and accessories, and installed plant for that purpose, but were handicapped by lack of capital, and they therefore borrowed £250 from his wife and a further £100 from a Mr. O. E. Nielson, on the understanding that a company should be formed and debentures created and issued in respect of such advances. By an agreement, dated January 30th, 1925, made between Jacob Johannus Morch and the company, the latter purchased the assets of the business for a consideration of £2,526, to be satisfied by the allotment to himself and his wife of all the share capital of the company, £1,000, as fully paid up, a cash payment of £156, and by the company discharging all the debts and liabilities of the vendor in relation to the business, he being indemnified

against all claims in respect thereof. The company also carried on a retail shop at Lower Clapton Road, London. In March, 1925, the directors issued five 6 per cent. debentures of £50 each to Mrs. Gladys Morch and two like bonds to Nielson as security for loans which they had advanced to the business prior to the formation of the company. Those bonds, having been issued for a past consideration within three months of the commencement of the liquidation, were invalid. According to Morch a contract was obtained for the supply of about £800 worth of radio goods, but after about £300 worth had been supplied the buyers refused to take delivery of the remainder which were in stock in various stages of manufacture, with a consequent loss to the company. On May 21st, 1925, the debenture holders appointed Mr. C. T. Payne as receiver on their behalf. The failure of the company is attributed to trade depression and illness of the managing director, which prevented his giving the necessary attention to the company's business. In the opinion of the Official Receiver the failure is due to entire lack of working capital. The Official Receiver had disposed of the assets by public auction; the gross proceeds amounted to £245, which has been credited to a suspense account pending a decision of the debenture holders as to whether they will take action to establish the validity of their charge. Mr. Charles Latham, 78, New Oxford Street, W.C., has been appointed liquidator.

ANGEL SUPER SIGNS, LTD., Lichfield Grove Works, Finchley, N.—The creditors met recently and a statement of affairs was submitted which disclosed liabilities of £2,203 and net assets of £900, leaving a deficiency of £1,213. The company was incorporated in January, 1924, taking over the business previously carried on by Mr. Angel, Senr., and Mr. Jarvis. A balance sheet of the company for the year to January 31st, 1925, showed a turnover of £6,821, and a gross profit of £1,735, but after allowing for overhead charges, there was a net loss of £144. For the period to October 31st last the turnover was £5,446, on which a gross profit of £1,313 was made, but there was a net loss of £931. It was eventually decided to confirm the voluntary liquidation of the company with Mr. W. R. Clemens, C.A., as liquidator. A committee of inspection was also nominated.

NORTH BRITISH DIESEL ENGINE WORKS, LTD.—Winding up voluntarily. Liquidator, Mr. N. M. Lindsay, Clydeholm, Whiteinch, Glasgow.

BELGRAVIA ELECTRICAL CO., LTD.—A meeting of creditors is called for December 29th at the offices of Messrs. Annan, Dexter & Co., 21, Ironmonger Lane, E.C. Liquidator, Mr. W. H. Lovatt.

Dissolutions of Partnership.—ELECTRIC PUBLICITY CO., electric sign manufacturers, 7, Chichester Rents, Chancery Lane, W.C.—Messrs. S. Dallaway, H. Mundy, and G. F. S. Goodwin have dissolved partnership.

DYER & CO., electricians, decorators and dealers in wireless supplies, Park Road, Bingley.—Mr. W. P. Dyer and Mr. C. G. Snelgar have dissolved partnership. Mr. Dyer will attend to debts and continue the business under the same style.

A French Fair.—A Commercial and International Fair is to be held at Lille from April 2nd to 18th, 1926. Full details may be obtained from the Comité de la Foire de Lille, 73, Rue Faidherbe, Lille.

Change of Address.—The address of the Portsmouth Corporation Electricity Supply Department head office is now: High Street, Portsmouth.

Irish Free State Electrical Imports.—The official returns show that the imports of electrical goods into the Irish Free State during September last amounted to a value of £39,594, as compared with £22,853 in September, 1924. The total for the first nine months of the year amounted to £249,032, as against £290,774 in the corresponding period of last year. It should be noted that dynamos and other electrical machinery are not included in the foregoing figures.

New Belgian Companies.—A new company has just been formed at Molenbeek-St. Jean, Brussels (2, Chaussée de Ninove) with a capital of one million francs and the title La Société de l'Union Electro-technique to manufacture electric fans, bells, and measuring instruments.

La Société Générale des Forces Hydro-Electriques du Katanga has been formed in Brussels, with a capital of 75 million francs, to establish hydro-electric power stations in the Belgian Congo.

Unemployment.—The Employment Exchange returns for the week ended December 7th showed a total of 1,161,000 unemployed persons, as compared with 1,165,275 a week earlier, and 1,182,188 at the equivalent date of last year.

Calendars, Diaries, &c.—MESSRS. MEASUREMENT, LTD., of 118, City Road, London, E.C.1, have prepared a very neat gilt-edged pocket diary for 1926, with adequate daily space, a thumb index to months, and an alphabetical index to names and addresses.

We have again received from MESSRS. F. C. POLDEN & CO., LTD., one of their pocket books. This is handsomely bound in dark red leatherette and contains a diary having a double page for each week and ample memoranda space; a really serviceable article.

BRITISH INSULATED & HELSBY CABLES, LTD., has sent us a set of 1926 refill cards for its calendar.

From the POWER EQUIPMENT CO., LTD., we have had a wall calendar with bold-figured monthly sheets.

The calendar issued by MESSRS. JOHN ARMSTRONG & CO. (MANCHESTER), LTD., is graced by an unbobbed beauty in riding kit. The calendar is a block of daily slips.

MESSRS. J. SHAW, SON & GREENHALGH, LTD., have sent us a "Utility" calendar with a block of large-fiured daily slips.

MESSRS. COLLINS ELECTRICAL, LTD., have adopted the humorous style for their 1926 calendar. This consists of two-monthly date sheets, each bearing a coloured drawing.

From the KEY ENGINEERING CO., LTD., we have received a little celluloid slip combining the functions of a calendar and a rule, with English and metric measurements.

MESSRS. LINDSAY & WILLIAMS, LTD., have sent us a "Utility" calendar mounted in an omega—recalling the company's "Megohmoid" insulation.

The WALKER ELECTRICAL SERVICE (Edinburgh) is issuing a wall calendar with monthly slips and illustrations of repair work.

From MESSRS. POYNTER, GRIFFITHS & CO., LTD., of Maxim Lamp Works, Canonbury Road, London, N.1, we have received a wall calendar with small monthly slips placed beneath a picture demonstrating the illuminating qualities of the Maxim lamp and the charms of the damsel who holds it.

Mr. ERIC THOMPSON, of The Electric Shop, Thirsk, has sent us a wall calendar with monthly slips below a coloured study inducing pleasant recollections.

The calendar received from MESSRS. GEORGE NOBBS, LTD., has monthly slips and an illustration of an electrically-equipped bathroom.

RADIO INSTRUMENTS, LTD., has again sent us a copy of its diary. This contains a great deal of useful information on radio matters, including a list of British amateur transmitters.

MESSRS. T. J. GRAINGER & CO., LTD., of 20, Eldon Square, Newcastle-on-Tyne, have issued a large wall calendar with boldly figured daily slips.

Book Notices.—"Case-Hardening Practice" (32 pp., illustrated). Huddersfield: David Brown & Sons (Huddersfield), Ltd.—This brochure contains a very detailed report of researches carried out in the case-hardening of steel by the company's research staff. It is profusely illustrated with photo-micrographs.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIV. No. 348. December, 1925. London: The Institution. Price 10s. 6d.

"Insulated Electric Cables, I. Materials and Design," by C. J. Beaver. Pp. 264; figs. 71. London: Ernest Benn, Ltd. Price 36s. net.

"The 'Bennis' Standard Evaporation Tables" (14 pp.). Compiled and calculated by G. A. Rossetti. Bolton: Messrs. E. Bennis & Co., Ltd. Price 2s. 6d. net.—These tables, based on Prof. Callendar's data, are designed to assist in the rapid and accurate determination of boiler outputs, efficiencies, fuel consumption, &c.

Electrical Prospecting.—In their report for the past year the directors of the Rhodesian Congo Border Concession, Ltd., state:—"Assisted by electric prospecting, which has proved most effective, making possible the accurate mapping of ore deposits which do not come to the surface, three additional ore bodies were discovered. These have been tested by drill holes with most satisfactory results."

Lighting and Power Notes.

Australia.—MELBOURNE.—According to the *Electrical Engineer of Australia and New Zealand*, the City Council has adopted a recommendation of the Electric Supply Committee for a reduction of the electric lighting tariff throughout the Council's supply area by ½d. per kWh during the summer months—October to March. The new rates are: First 1,000 kWh per month, 3d. per kWh; next 1,000 kWh, 2½d., all further consumption 1½d. per kWh. The reduction is made with a view to assisting shopkeepers and others who use large amounts of energy for lighting.

WESTERN AUSTRALIA.—It is reported that the Western Australian Government will introduce, at an early date, a Bill for the constitution of an Electricity Commission to take charge of electricity supply matters in the State.

Barnes.—ELECTRICITY SUPPLY.—With reference to the Urban District Council's proposal to extend the plant at its electricity works, a communication has been received from the Electricity Commissioners intimating that they are of opinion that the interests of consumers would best be served by the Council's acceptance of the terms offered by the County of London Electric Supply Co., Ltd., and not proceeding with extensions to its generating plant. The Council has considered the Commissioners' report and has voted against the proposal to take a bulk supply. Application is to be made for authority to extend the generating plant.

Bedford.—LOANS.—The Electricity Committee has decided to apply for sanction to loans of £20,000 for mains and £5,000 for transformers and switchgear.

Sanction has been given to the following loans:—New offices for the electricity undertaking, £2,300; adaptation of boiler house, £430; domestic apparatus, £3,000; meters, £5,000; evaporating plant, £1,000.

EXTENSION OF SUPPLY.—The Committee has recommended a scheme to supply electricity to Bromham village, at an estimated cost of £5,736.

Bexhill.—NEW PLANT.—The Town Council has received an intimation from the Unemployment Grants Committee of its approval of the installation of a 1,259-kW converter, with switchgear, &c., at the electricity works for the purpose of a grant. Application has been made to the Electricity Commissioners for sanction to the scheme and to the borrowing of the necessary loan to cover the cost.

Blean.—OPPOSITION TO SCHEME WITHDRAWN.—The Rural District Council has withdrawn its objections to the application of Messrs. Hunt for an Order to supply electricity in the Council's district.

Brighton.—ELECTRICITY IN BULK.—The borough electrical engineer is making arrangements to provide a bulk supply of electricity to the Shoreham and District Electric Lighting Co., Ltd.

LOANS SANCTIONED.—The Electricity Committee has obtained sanction to the following loans:—£2,225 for structural alterations to the North Road sub-station; £45,000 for mains and services; and £4,050 for mains and services in connection with the supply in the urban district of Portslade-by-Sea.

Continental.—CZECHO-SLOVAKIA.—The municipal authorities of Kaaden have recently established a hydro-electric power station to utilise the water power of the River Eger in Northern Bohemia. The plant, which works under a head of about 90 feet, comprises two Voith turbines coupled to generators, of 1,745 and 3,270 h.p. respectively. A third set of 4,080 h.p. is to be installed later. The distribution system is being connected up with the power station at the collieries of the Poldihutte at Komotau so that a reserve supply will be available in case of excessively dry periods reducing the water supply.

Darley Dale.—INQUIRY DECISION.—In connection with the inquiry held by the Ministry of Transport recently into the objections raised by local authorities and the residents of Darley Dale to the proposal of the Derbyshire and Nottinghamshire Electric Power Co., to erect overhead cables from Matlock to Darley Dale, the Ministry has given its decision in favour of the company's proposal.

East Ham.—MAINS EXTENSIONS.—The Electricity Committee is to carry out mains extensions at an estimated cost of £1,876.

Faversham.—ELECTRICITY SUPPLY.—The Town Council is to provide an additional cable to the works of Mexco, Ltd., for a further supply of electricity on condition that the firm guarantees a consumption of not less than 60,000 kWh per annum for five years. The Council is considering a new scale of charges for power consumers of more than 50,000 kWh per annum.

Hamilton.—ELECTRICITY SUPPLY.—From January 1st next the burgh's electricity supply will be taken over by the Town Council from Messrs. Edmundsons Electricity Corporation, Ltd., and the Electricity Committee has recommended reduced rates for lighting, heating, and power, which, however, have been postponed until the results of the past year's working have been ascertained. It is reported that two companies are prepared to submit schemes for a hydro-electric installation on the River Clyde.

Ilford.—ELECTRICITY IN BULK.—The Electricity Committee has considered the report of the chairman and the electrical engineer with reference to their interview with representatives of the County of London Electric Supply Co., Ltd., regarding the question of a bulk supply of electricity from the company, and has reported to the Council that, having regard to the increased maximum demand for a bulk supply of electricity from the West Ham Corporation and to the estimated requirements of the Council's electricity undertaking for the period 1926-1927, arrangements be made with the company for a bulk supply of electricity (required in excess of the increased maximum demand, *viz.*, 2,000 kW, from the West Ham Corporation) upon detailed terms to be agreed upon, and subject to contract and to the approval of the Electricity Commissioners.

Loughborough.—EXTENSION OF SUPPLY.—The extension of the cable to Nanpantan, at a cost of £2,420, has been approved by the Town Council.

Lowestoft.—LOAN.—The Town Council is applying for sanction to a loan of £2,000 for meters.

Ludlow.—PURCHASE OF UNDERTAKING.—The Town Council has come to an agreement for the acquisition of the undertaking of the Ludlow Electric Light Co., Ltd., for £7,000, and has applied for an Order authorising it to take over the undertaking.

New Zealand.—CHRISTCHURCH.—The report on the working of the municipal electricity undertaking (engineer: Mr. J. C. Forsyth) for the year ended March 31st last shows a total revenue of £146,546, as compared with £123,432 in 1923-24. Working expenses amounted to £33,561, as against £26,181, and the purchase of a bulk supply from the Lake Coleridge station of the Public Works Department £29,599 (£26,109). After deducting interest and other charges, there was a net profit of £14,320, as compared with £22,790 in the preceding year. The electrical energy sold increased from 18,979,956 to 22,511,181 kWh, and the maximum supply demanded from 5,640 to 6,460 kW. During the year five new sub-stations were put into operation, and 88½ miles of l.p. overhead mains were erected, bringing the total to 218 miles. A loan of £375,000 has been arranged to cover anticipated extensions of the system during the next five to seven years.

Northern Ireland.—DONAGHADEE (CO. DOWN).—At a recent meeting of the Urban District Council a recommendation of the Finance Committee that tenders be invited for lighting the town by electricity or gas was adopted.

Peebles.—OPPOSITION TO ORDER WITHDRAWN.—The Town Council has withdrawn opposition to the application of the Galashiels and District Electric Supply Co., for an Order to supply electricity in the town.

Fort William.—BREAKDOWN.—The bursting of a cell at the accumulator house damaged dynamos and other plant at the generating station recently, and for a time the town was in darkness.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

PONTYPRIDD.—Ordinary lighting: From 6½d. to 6d. per kWh. Slot meters: From 7½d. to 7d. per kWh. Heating: Winter quarters—first 100 kWh, 2d. per kWh, all energy in excess, 1½d. per kWh; summer quarters—first 100 kWh, 1½d. per kWh, above this amount, 1d. per kWh. Large consumers who are prepared to take 500 kWh per quarter per kW demanded: Flat rate of 1½d. per kWh in the winter and 1d. per kWh in the summer.

BRIGHTON.—Lighting: First 10,000 kWh, from 5d. to 4½d. per kWh, the remaining sliding scale charges to be as at present. Power, heating, and cooking: Flat rate from 1½d. to 1d. per kWh. Street lighting: From 2d. to 1¾d. per kWh. Tramway supplies: From 1.3d. to 1.2d.

LOWESTOFT.—Power: Varying from 2¾d. to 1½d. per kWh, according to the quantity consumed.

BRADFORD.—Heating and cooking (except to consumers taking a supply on the rateable value system: From 1½d. to 1d. per kWh.

WOLVERHAMPTON.—The charges to be reduced from 33⅓ per cent. to 25 per cent., above the pre-war rates.

Skegness.—ELECTRICITY SCHEME.—The Finance Committee has recommended to the Town Council that the subject of a public supply of electricity be deferred for one year. The Council had decided to install its own generating plant.

South Devon.—INQUIRY DECISION.—In connection with the inquiry held in July last into two applications for authority to supply electricity in a large rural area of South Devon, the Electricity Commissioners have intimated that an Order has been granted to the Teignmouth Electric Lighting Co., Ltd., authorising it to supply electricity in certain villages.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Gwynedd Trust, Ltd., to supply electricity in parts of the rural districts of Gwyrfai and Ogwen, in the rural districts of Forden, St. Asaph, Holywell, and Congleton, the boroughs of Welshpool, Montgomery, Denbigh, and Flint, and the urban districts of Sandbach, Alsagar, and Holywell.

The Electrical Distribution of Yorkshire, Ltd., has applied for an Order authorising it to supply electricity in the urban district of Clayton.

Stoke.—EXTENSION OF SUPPLY.—The Electricity Committee has decided to supply electricity to the Abbey Hulton housing estate and is applying for sanction to a loan of £4,000 to cover the cost.

Sunderland.—ELECTRICITY EXTENSIONS.—The Corporation is to construct an underground switch chamber at the corner of High Street West and Bridge Street, at an estimated cost of £4,550. Extensions of mains are to be carried out at an estimated cost of £2,297, and application is to be made for an Order for the acquisition of land and buildings for the purpose of electricity works extensions.

STREET LIGHTING.—The Corporation has installed "Wembley" lanterns of 3,000 c.p. for the lighting of three main streets.

Swansea.—OPPOSITION TO ORDER.—It was reported at a recent meeting of the Town Council that the Llanelly and District Electric Supply Company, Ltd., had applied to the Electricity Commissioners for an Order authorising it to supply electricity to the Gorseinon Electric Light Company, Ltd., and that the Town Clerk had lodged objections to the application on the ground that the Gorseinon Company had an agreement with the Corporation by which "the Corporation shall supply such electrical energy as the company may from time to time require."

Turkey.—ELECTRICAL DEVELOPMENT.—According to the report of the Société Turque d'Electricité the power stations of the company in Constantinople produced during the last financial year 40,010,486 kWh, an increase of 5,603,806 kWh as compared with 1923-24, while the sales advanced from 27,626,175 to 33,408,983 kWh. The number of consumers increased from 30,228 to 32,752. Since June last the company has been supplying electricity to the suburbs of San Stefano and Sar Yar on the Upper Bosphorus and has entered into an agreement to give a supply to the Kadikeny Gas Co. on the Asiatic bank of the Bosphorus.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—The New York correspondent of *The Times* reports that plans have been prepared for the development of water power on a large scale, along the Tennessee River. By building 100 dams on the river and its tributaries, it is calculated that it would be possible to develop at least 4,000,000 h.p. The machinery on the Wilson Dam at Muscle Shoals is now ready. The completion of

other dams higher up river will, it is believed, permit Muscle Shoals alone to develop 612,000 h.p., maintained steadily at all seasons. Four companies have already applied to the Federal Power Commission for permits to build 24 of the projected dams with an estimated development of a further 1,441,000 h.p.

Worthing.—SPECIAL ORDER.—The Electricity Commissioners have notified the Town Council that they propose to grant its application for a Special Order authorising it to extend the present area of electricity supply to Sompting, Findon, Angmering, and Rustington.

West Riding (Aire and Calder) Electricity District.—A deputation from the conference of local authorities in connection with the West Riding (Aire and Calder) Electricity District waited upon Sir John Snell in London recently in connection with the breakdown of the proposed scheme for a joint supply of electricity to the West Riding by the local authorities and the Yorkshire Electric Power Co., consequent on the withdrawal of the latter from the scheme. The proceedings were private, and no statement was issued.

Weymouth.—NEW PLANT.—The Electricity Committee has decided that the following plant and mains be installed, subject to the approval and consent of the Electricity Commissioners to obtaining the plant and extending the area of supply:—Two 20,000-lb. water-tube boilers; two 1,500-kW turbo-alternators; two 500-kW rotary converters; two 750-kVA transformers; together with the necessary auxiliaries in pipework, condensers, circulating-water system, buildings, foundations, &c. It is also recommended that h.p. mains be laid to Wyke and Upwey, together with the laying of the l.p. mains in these areas. The total estimated cost of the proposed work is £52,185 for generating plant, &c., and £22,977 for mains and sub-stations.

Tramway and Railway Notes.

Australia.—WESTERN AUSTRALIA.—We have received from Mr. W. H. Taylor, general manager of the Government tramway undertaking, a copy of his report, together with the statement of accounts, for the year ended June 30th last. The total income amounted to £281,612, as compared with £274,583 in the preceding year, and the working expenses were £236,008, as against £231,895, leaving a gross profit of £45,604 (£42,688). Interest charges absorbed £44,835, and there was a net surplus of £769, as compared with a loss of £155 in 1923-24. The number of passengers carried increased from 27,893,315 to 28,894,525, and the car-mileage from 2,989,089 to 3,040,505.

Continental.—ITALY.—The Milan-Sarrono line and the Bovisa-Meda section of the Milan-Erba line of the North Milan Railway Co. are to be electrified.

A contract has been concluded for the construction of an electric tramway, passing along the Mediterranean coast between Leghorn, Pisa and Marina-di-Pisa. It is intended to begin work early in the new year.—*Reuter's Trade Service* (Pisa).

PORTUGAL.—According to the *Railway Gazette*, the first railway to be constructed in Portugal, Cascaes-Caes do Sodrè, is now being electrified and the scheme is nearing completion. It is expected that the electrical service will be ready early in 1926.

SWITZERLAND.—Good progress is being made with the electrification of the Zurich-Meilen-Rapperswil section of the Swiss Federal railways, and it is expected that the work will be completed by May next.

Edinburgh.—TRAMCAR EQUIPMENT.—A sub-committee of the Corporation Tramways Committee has recommended that 25 sets of air brakes be purchased at a cost of £3,875.

Glasgow.—THROUGH RUNNING.—The Tramways Committee has decided not to proceed further with the proposed arrangement with the Lanarkshire Tramways Co. for reciprocal running powers on its tramways.

London.—NEW TUBE SERVICES.—The new tube extensions from Clapham to Morden and from Charing Cross to Kennington, *via* Waterloo, are scheduled to be in service next midsummer, and it is expected that 5,577 trains a day will serve the various termini of the Hampstead and City lines, together with their extensions. The operation of these services will entail the employment of about 300 additional men.

Manchester.—NEW DEPOT.—The *Daily Dispatch* reports that the Tramways Committee has accepted a tender for the construction of a car shed in Birchfields Road, Rusholme, at a cost of £150,000. It is expected that the work will provide employment for about 100 men for nine months, and that the depôt will be completed before next winter.

Manchuria.—NEW TRAMWAY.—It is reported that the Siemens-Schuckertwerke, of Berlin, has secured the contract for the construction and equipment of an electric tramway in the town of Harbin, North Manchuria.

Stoke-on-Trent.—INQUIRY.—An inquiry was held on December 15th by Mr. R. Tolerton, on behalf of the Minister of Transport, into an appeal by the Potteries Electric Traction Co. against a decision of the Corporation attaching conditions with respect to the routes upon which thirteen omnibuses belonging to the company might ply for hire. According to the *Birmingham Post*, the company asked for an Order that the thirteen omnibuses which are now running on country routes only might also be allowed to run on the main route through the six Potteries towns. Opposition was offered by the Corporation. Mr. Rowand Harker, for the company, said the grounds of the application were that it would facilitate the working of the traffic and give the company a fairer share of the main route traffic than at present, and so assist it in meeting its present difficult financial situation. Mr. R. J. Howley, chairman of the company, gave evidence that the effect of omnibus competition on the tramway undertaking had been very serious, the tramcars being now worked at a considerable loss. The company had a statutory obligation to run tramcars. Mr. Ward, for the Corporation, submitted that the number of omnibuses and tramcars now being run by the company showed that it had been treated fairly, but the district had an ample and adequate service to-day only because the licences were granted to private persons in opposition to the company.

The Minister's decision will be given in due course.

Telegraph and Telephone Notes.

Jugo-Slavia.—NEW RADIO STATION.—The Ministry of Posts and Telegraphs has authorised the erection of a wireless transmitting station at Agram (Zagreb), which will probably be opened by the first of March.—*Reuter* (Belgrade).

Marine Radio Operators.—STRIKERS' DEPUTATION.—Acting upon the advice of members at a meeting at the House of Commons, representatives of marine wireless operators approached both the President of the Board of Trade and the Minister of Labour seeking a personal interview. The reply from the Ministry of Labour stated that the Minister of Labour "regrets that he is not able at present to arrange to receive a deputation personally. An officer of the Department will, however, be prepared to see your Executive on December 21st." The reply from the Board of Trade states that the President "would be glad if you could send him a detailed statement of the points which you wish to raise."

Rugby Radio Station.—NOVEL FEATURES.—Dr. W. H. Eccles, vice-chairman of the Wireless Telegraphy Commission, points out in *The Times* that the hub of the Imperial radio communication scheme is the station at Rugby, which was designed by the Commission and the Wireless Section of the Engineering Department of the Post Office. The masts, power plant, auxiliary machinery, and thermionic valves have all been supplied by British contractors; the buildings have been erected by the Office of Works; the high-frequency circuits have been made and installed by the Engineering Department of the Post Office. The Commission, being unfettered in its choice of methods and apparatus, has been able to break away from standard practice and therefore the station "is full of novel features." Thermionic valves solely are used for generating the electrical waves, the sum total of the valve power amounting to about 1,500 kilowatts, three times as great as that of any other valve station. Of this equipment two-thirds will be used for Morse telegraphy and one-third will be reserved during the coming year for experiments in long-range telephony. Telegraphy will be conducted on both long and short waves, so that several messages may be sent simultaneously to various parts of the globe. The telephony plant has a range of more than 5,000 miles.

A unique feature is the fact that the waves radiated from the aerial have their origin in the vibrations of a tuning fork, which are magnified by stages, by banks of thermionic valves, till they reach the total of over 700 h.p. and pass to the aerial circuits. The fork thus governs the wavelength and keeps it rigorously constant. "Rugby is the first great station absolutely free from involuntary variations of wavelength and will revolutionise the methods of preventing interference between wireless services." This new method has been developed within the Wireless Section of the Post Office. During the preliminary trials quarter power reached Java and Hong-kong; half-power was heard well in Australia and very strongly in America; still higher power gave good signals in New Zealand and was reported "stronger than any other station" by South Africa, and was stated to give signals of "amazing clarity" in Sydney. The tests made in Rugby town, two miles from the station, to ascertain how far the concerts from the B.B.C. station at Daventry, 12 miles away, are interfered with by the Morse transmission at Rugby, proved that although Rugby was, at the time, using in its aerial about 25 times the power used in the Daventry aerial, there was no interference at all.

The Rugby station will start upon its Imperial mission as soon as range tests are completed, within two or three months. This all-round service will be supplemented by a "beam" service to each of the four largest Dominions as soon as the "beam" stations have passed similar tests. In the meantime the long- and short-wave equipment at Rugby will ensure satisfactory transmission to every part of the Empire throughout the 24 hours, says Prof. Eccles.

Turkey.—SMYRNA TELEPHONE CONCESSION.—Under a contract signed by the Minister of the Interior on behalf of the Turkish Government, a concession has been granted to the municipality of Smyrna for the installation and operation of a telephone system for a period of 35 years. Service will be provided for 2,000 subscribers. The installation must be completed in the city itself within a year and three months after the capital is procured, and within two years in the suburbs.

Radio Notes.

Finland.—BROADCASTING COMPANY.—At a meeting held on December 12th a number of companies and private persons interested in broadcasting in Finland decided to form a joint stock company to make arrangements for broadcasting in Finland. The company will probably begin its activity on January 1st.—*Reuter's Trade Service* (Helsingfors).

Licences.—SCOTTISH PROSECUTIONS.—As a result of the "examination of suspected premises" 600 summonses have been issued against residents in Aberdeen who are suspected of possessing unlicensed broadcast receiving sets. According to the *Daily Express*, the prosecutions are based on the possession of aerials, either of the indoor or outside types, which are capable of reception.

LONDON CONVICTION.—Mr. Arthur Plowman, of Kentish Town, was fined 10s. at the St. Marylebone Police Court on December 18th for installing wireless apparatus without having purchased a licence. It was stated that the Postmaster General considered it necessary to prosecute in all such cases.

Radiophony Union.—BRUSSELS CONFERENCE.—The International Broadcasting Conference has decided to proceed with systematic tests based on a scheme submitted by the Technical Committee in order to ascertain the best method of lessening interference between the large number of European stations. In view of the urgency of the matter, a technical sub-committee has been appointed, of which Captain P. P. Eckersley is a member, which is to meet shortly and draw up a programme for the proposed tests.—*Reuter* (Brussels).

The congress sat under the presidency of Rear-Admiral C. D. Carpendale (Great Britain), France, Germany, Holland, Czecho-Slovakia, Spain, Norway, Sweden, Austria, Italy, and Belgium each sent delegates, while the International Radio Office was represented by Mr. A. Burrows.

Switzerland.—BERNE STATION.—The inaugural transmission from the Berne broadcasting station, which took place on November 19th, was successfully received in Great Britain, all over Switzerland, Italy, Portugal, Germany, France, Czecho-Slovakia, Belgium, and even as far away as Argentina, where the transmission was very good. In view of the fact that the country surrounding the Berne station is of a mountainous nature, the reports of reception are very satisfactory. The station has a Marconi 6-kW transmitter, similar to the apparatus used in the majority of British stations and the building also contains the two telegraph transmitters for services "*Via Marconi*" between Great Britain and Switzerland, but the close proximity of the sets produces no mutual interference. The two telegraph transmitters operate simultaneously at high speed on one aerial, and an independent aerial has been erected for the broadcast transmitter, which operates on 302 metres.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—April 12th, 1926. State Electricity Commission of Victoria. Plant for the Sugarloaf and Rubicon hydro-electric scheme, consisting of turbo-generators, transformers, switchgear, cranes, and accessory plant. (December 11th.)

Victorian State Railways. January 13th. Double recording wattmeter.* January 20. Automatic battery-charging equipment.*

Ayrshire.—December 31st. Education Authority. Electrically wiring the extension to Ochiltree school. Specifications from Mr. Wm. Reid, master of works, Education Offices, Ayr.

Beckenham. — January 14th. Electricity Department. Water-heating and softening plant. (December 18th.)

Birmingham.—January 9th. Tramways Committee. 50 tramcar bodies. Forms of tender (£2) from Mr. A. Baker, general manager, Tramways Offices, Birmingham.

Brentwood.—January 1st. Guardians of Billericay Union. Electrical wiring in conduit and installation of complete electric generating plant at the Institution, Billericay. (December 11th.)

Dublin.—December 29th. Commissioners of Public Works. Installation of electric lighting at the Irish Land Commission Offices, Upper Merrion Street, Dublin. Specification (20s.) from the Secretary, Office of Public Works, Dublin.

Dundee.—January 14th. Electricity Department. Two electrically-driven centrifugal drainage pumps controlled by float gear. (December 18th.)

Town Council. Electric lighting installation at day nursery, North George Street. Particulars from Mr. G. Baxter, city engineer.

Edinburgh.—January 4th, 1926. Electricity Supply. Two 1,200-b.h.p., 6,600-V, 3-ph. induction motors. (December 11th.)

Edmonton.—Education Committee. Wiring offices at Brettenham Road, Edmonton, for electric light. (December 11th.)

Egypt.—CAIRO.—February 20th. Director-General, Mechanical Department, P.W.M. Power Plant for Giza.

January 20th. Local Commissions Section. Elector motor and accessories at Manfalout waterworks.*

KHARTOUM.—March 15th. Inspector-General of Irrigation, Sudan. Travelling and overhead cranes, dynamos, motors, and storage batteries for the equipment of the irrigation dock at Rabak, on the White Nile. Specification from the Inspector-General of Irrigation, Sudan, Khartoum.—*Reuter's Trade Service* (Cairo).

London.—LONDON COUNTY COUNCIL.—December 31st. Renewal of the storage battery at Bexley Mental Hospital. (December 11th.)

CAMBERWELL.—January 11th, 1926. Borough Council. Stores, including electric lamps, for 12 months. Particulars from Borough Engineer, Town Hall, Camberwell.

METROPOLITAN ASYLUMS BOARD.—December 30th. Installation of fire-alarm system at Tooting Bec Hospital. (December 18th.)

LAMBETH.—January 5th. Board of Guardians. Twelve months' supply incandescent electric lamps. (See this issue.)

SHOREDITCH.—January 27th. Electricity Department. One 50,000-lb. water-tube boiler, with economiser, forced and induced draught, &c.; one 10,000-kW turbo-alternator, with condenser, pumps, &c. (See this issue.)

BETHNAL GREEN.—January 19th. Board of Guardians. Three Lancashire boilers for the Hospital, Cambridge Road. Specifications, &c., from Mr. C. F. Jones, clerk to the Guardians, Bishops Road, Bethnal Green, E.

Manchester.—December 30th. Electricity Committee. One single unit (or, alternatively, one double unit) three-phase induction regulator. (December 11th.)

Two 1,000-kW and seven 750-kW motor converters, or, alternatively, rotary converters and static transformers. (December 18th.)

January 12th. Tramways Committee. Steel girder tramway rails. Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

January 6th. Board of Guardians. Electric lighting installation at the pathological and dispensing block, Crumpsall Infirmary. Specifications from Mr. A. J. Murgatroyd, architect, 23, Strutt Street, Manchester.

New Zealand.—WELLINGTON.—February 16th. Public Works Department. Outdoor switchgear for the Waikato electric power scheme.*

March 2nd. Synchronous condenser and transformers for the Arapuni electric power scheme.*

30,000-V switch and protective apparatus for Lake Coleridge electric power supply.*

AUCKLAND.—February 8th. Auckland Electric Power Board. Overhead cotton-covered triple-braided cable.*

February 22nd. 15-amp. cut-outs.*

DUNEDIN.—February 26th. Otago Harbour Board. Motors, control gear, and cable.*

Preston.—January 15th. Electricity Department. Supply and erection of approximately 15 miles of 33,000/45,000-V double transmission lines. (December 11th.)

Slaithwaite.—No date. Electric light installation at the Co-operative Hall, Carr Lane, for Slaithwaite and District Co-operative Society, Ltd. Specifications from the Society's offices.

South Africa.—JOHANNESBURG.—January 28th, 1926. S.A. Railways and Harbours. Eleven 4-ton electrically-driven wharf jib cranes and seven electric capstans for Durban Harbour. Secretary to the Tender Board, S.A.R. Headquarters, Johannesburg.*

January 21st. Municipal Council. 106 current transformers.*

February 26th. Motor-driven air compressor, with electrical equipment.*

CAPE TOWN.—January 27th. Electricity Department. Oil-cooled transformers.*

UNION TENDER BOARD.—January 28th. Miscellaneous telegraph and telephone materials for the Department of Posts and Telegraphs.*

Uruguay.—February 23rd, 1926. State Electricity Supply Works. Porcelain insulators and accessories.*

D.c. and a.c. meters.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Ashtead.—City of London Schools Committee. Recommended. Re-wiring at orphan school premises.

H. E. Keen & Co. (Recommended.)	**£757**
F. Polden & Co., Ltd.	783
V. G. Middleton & Co.	1,175
Higgins & Griffiths, Ltd.	1,219

Australia.—SYDNEY.—Electricity Supply Committee. Recommended :—

Fibre conduits (£4,934).—Western Electric Co. (Aust.), Ltd.
L.p. shackle insulators (£433).—New South Wales Insulator Works.

NEW SOUTH WALES.—Railways Department. Accepted:—
Equipment for Lakemba (Belmore) and Gordon sub-stations (£21,439).—Australian General Electric Co., Ltd.
Electric travelling jib crane for White Bay power house (£2,858).—Gibson, Battle & Co., Ltd.
72 D.K. traction motors (£19,586).—English Electric Co., Ltd.

MELBOURNE.—Victorian Railways. Accepted:—
Overhead electrical equipment, at rates.—British Insulated & Helsby Cables, Ltd.

State Electricity Commission of Victoria.
Switchgear and accessories (£870).—Ferguson, Pailin, Ltd.

Commonwealth Postmaster-General's Department, Victoria.
Insulators.—R. Fowler, Ltd. (£5,100); Firebrick Insulator & Pottery Co. Pty., Ltd. (£5,674); Calyx Porcelain Co., Ltd. (£3,921).
Telephones, all states (£22,733).—British L. M. Ericsson Tel. Mfg. Co., Ltd.
Transformers (£6,965).—Western Elec. Co. (Aust.), Ltd.
—*Tenders.*

Bexhill.—Electricity Committee.
Battery booster (£205).—Bruce Peebles & Co., Ltd. (accepted.)
500 yd. of 3-core cable (£94).—British Insulated & Helsby Cables, Ltd. (recommended).

China.—SHANGHAI.—Shanghai Electric Construction Co., Ltd. Accepted:—
50 motors for trackless trolley 'buses.—E. R. & F. Turner, Ltd.

Epsom.—Urban Council. Accepted:—
Renewal of battery, &c. (£794, less £50 for old material).—D. P. Battery Co., Ltd.

Lamp Contracts.—The British Thomson-Houston Co., Ltd., has received contracts for the supply of "Mazda" electric lamps from the Great Western Railway Co. and the Pacific Steam Navigation Co.

Leyton.—Electricity Committee. Accepted:—

	Two traction motor converters.		Two general supply motor converters.	
	Speed.	Amount.	Speed.	Amount.
		£		£

London.—ST. MARYLEBONE.—Electricity Committee.
Three integrating meters, with transformers, &c. (£195).—Chamberlain and Hookham, Ltd.

STEPNEY.—Electricity Committee.
2 tons plumber's solder, ½ ton tinman's solder, and ¼ ton blowpipe solder (£318).—G. W. Neale, Ltd. (accepted).
50 T C disconnecting boxes (£107).—Universal Electrical Mfg. Co., Ltd. (recommended).
50 single disconnecting boxes (£59).—W. Lucy & Co., Ltd. (recommended).
3 tons sheet lead (£146).—G. Farmiloe & Sons, Ltd. (accepted).
50 tons pitch (£134).—Smart's Tar Distillery, Ltd. (accepted).

Luton.—Offices Committee. Accepted:—
Internal telephone installation at Council offices (£200).—Standard Telephones & Cables, Ltd., London.

Peterborough.—Town Council. Accepted:—
Extensions to the generating station (£79,950).—Mitchell Conveyer and Transporter Co.

Housing Committee. Accepted:—
Wiring Council houses (£725).—Peterborough General Engineering Co.

Stoke-on-Trent.—Hospital Committee. Accepted:—
Electric lighting installation, Bucknall Hospital wards (£192).—Hawley and Ingram.

Electricity Committee. Accepted:—
Two air extractors (£491).—Metropolitan-Vickers Electrical Co., Ltd.

York.—THE TURBO-ALTERNATOR CONTRACT.—According to the *Yorkshire Herald*, the Electricity Committee is holding up the decision to purchase Swiss electrical plant. As mentioned in our issue of December 11th, page 942, the Council decided to approve of the recommendation of the Electricity Committee to purchase Swiss machinery for £19,000 in preference to British plant, the lowest tender for which was £24,000; the voting was 23 votes for and 16 against.

The *Yorkshire Herald* states that, with the exception of the Rev. G. S. Woods, who is the chairman of the York Labour Party, the whole of the Labour members present at the meeting voted with the majority in favour of the recommendation. The majority decision has roused opposition among the citizens, and it is believed the Electricity Committee, having concluded that it ought not to spend £19,000 on foreign machinery, unless it has the full approval of the Council, will seek to raise the whole question at a further meeting.

Forthcoming Events.

Salford Technical and Engineering Association.—Saturday, December 26th. At the Royal Technical College. From 5.30 to 11.45 p.m. Annual social.

Junior Institution of Engineers.—Friday, January 1st. At 39, Victoria Street, S.W. At 7.30 p.m. Kinematograph lecture, "The Manufacture of Ordnance" and the "Rolling Mills and Crucible Melting Department at the River Don Works of Vickers, Ltd."

Electrical Power Engineers' Association.—Friday, January 1st. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "Automatic Boiler Control," by Mr. H. W. Holland.

Notes.

The Electrical Industry and Exhibition Policy.—An important meeting was held in London last week to consider in a preliminary way the subject of future electrical exhibitions and exhibition policy. It was convened by Mr. J. W. Beauchamp, Director of the British Electrical Development Association, and every section of the industry was represented through the various organisations. About fifty gentlemen were present and the ground covered in the course of the discussion concerned such matters as large exhibitions (along B.E.A.M.A. lines) and the frequency with which they should be held; the value of the smaller exhibitions in connection with which the B.E.D.A. renders such valuable assistance in all parts of the country; and the need for giving electrical support to the British Industries Fair until it became as big an event as the Leipzig Fair.

While nothing particular was decided on any of these points, something definite emerged in the shape of a liaison committee, connecting up all organisations concerned, which is to meet and discuss general principles and report to later meetings.

Appointments Vacant.—Assistant engineer, for the Lyme Regis Borough Council; switchboard attendants for Newport Corporation electricity department; senior lecturer in engineering for Cape Town Technical College; rolling stock and works superintendent (£300+) for the Wallasey Corporation tramways and motors department; clerk (£149) for the Beckenham U.D.C. electricity department. (See our advertisement pages to-day.)

Electric Lighting Demonstrations.—The second meeting of the Illuminating Engineering Society was held at the E.L.M.A. Lighting Service Bureau on December 16th, when Mr. C. W. Sully, Director of the E.L.M.A., presided. The report of the committee on "Progress in Electric Lamps and Lighting Appliances" was read by Mr. Hughes. Reference was made to the most recent B.E.S.A. specification for electric lamps and to recent lighting progress founded upon the work of the E.L.M.A. Lighting Service Bureau and the national campaign carried out by it in favour of better shop lighting. It was recalled that new provincial centres of the Association had recently been established in the Glasgow and North-East Coast districts. Following the presentation of the report Mr. W. E. Bush and Miss F. Hodges gave demonstrations of the shop-lighting and domestic-lighting displays, features of the Lighting Service Bureau which were described in our issue of September 18th last. The demonstrations were well attended and an animated discussion followed. A vote of thanks to the E.L.M.A. and to Mr. Sully terminated the proceedings.

Local Societies.—At Nottingham, on November 23rd, Mr. M. A. Crosbie, O.B.E., delivered the third lecture of the 1925-26 session of the Nottingham Society of Engineers. His subject, "Factory Equipment," covered the handling and separation of materials, mixing and refining, plodding and extruding, and weighing and measuring of small quantities.

At the Engineering and Scientific Club, Wolverhampton, on December 11th, Mr. F. H. Rosencrants, B.Sc., lectured on the development of powdered fuel in America and this country for the generation of steam for power purposes. Whilst in this country there are few boiler units at work with a capacity of 100,000 lb. of steam per hour, Mr. Rosencrants gave particulars and illustrations of many units working in the United States having a capacity of 200,000 lb. and 300,000 lb. of steam per hour; at the Ford Car works there are several boilers of this size, which, after the completion of certain alterations now being effected, will have a steaming capacity of 500,000 lb. per hour. An important feature of these large units is the simplicity of control, only one man being required to control four of them. It is claimed that owing to the perfect combustion and refinements of powdered-fuel installations, efficiencies of 89 to 91 per cent. are being maintained in daily working.

Mr. S. T. Allen and Mr. J. Hargrove took part in the discussion, and Major S. J. Thompson, who presided, proposed a vote of thanks.

Contributions to Research.—The Swansea Town Council, on December 16th, approved of a contribution of £25 towards the expenses of the research work carried out by the I.M.E.A. Such payments fall within the scope of the powers of sanction conferred upon the Electricity Commissioners by the Act of 1919.

The Need for Salesmanship.—Writing in the current issue of the *Journal* of the Leeds Chamber of Commerce, Mr. A. M. Samuel, Parliamentary Secretary to the Department of Overseas Trade, emphasises the need for good salesmanship if export markets are to be found for our goods. Referring to the services offered by his Department, he says that, while the overseas officers could not act as commercial travellers, they can and do help in the appointment of suitable local agents. Adequate personal contact with customers is necessary, and principals of firms should make a point of visiting them. Where the expense of individual representation in a market cannot be justified, Mr. Samuel considers that co-operative representation should be considered.

Explosion at Barking Power Station.—Whilst going to Press we learn from the *Essex Weekly News* that a turbine at the Creeksmouth power station of the County of London Electric Supply Co., Ltd., exploded on Monday last week, and that three employés, named Reid, Leaford, and Higgins, were seriously injured and were removed to hospital.

Technical Films.—The South Midlands Students' Section of the Institution of Electrical Engineers is holding an exhibition of technical films on January 11th at the Birmingham Temperance Hall, Temple Street, Birmingham, at 7 p.m., when a selection from the following list will be shown: A History of Electricity, entitled "From Coal Heap to Consumer" (E.D.A.); The Manufacture of a 50,000-kW Turbo-Alternator (Parsons); The Manufacture of Telephone, Rubber and Submarine Cables (Siemens); Electricity in a Steel Works; "The Story of Cotton"; The Panama Canal; The Manufacture of Tin-plate (B.T.-H.); The Osram Lamp Works (G.E.C.); Telephone Inventors of To-day; "On the Air"; and The Audion (Western Electric). We are informed that the Committee offers a welcome to any of our readers who care to attend the exhibition.

Fatality.—At the Manor Colliery, Stirling, on December 15th, Fred Grieve (14), residing in Stirling, was killed by electric shock while working at a washer at the pithead.

The Institute of Transport.—EXAMINATIONS.—The Council of the Institute announces that the last date for the receipt of applications for partial exemption from the Graduateship and Associate Membership examinations is December 31st, 1925. Applications should be addressed to the Secretary of the Institute, 15, Savoy Street, London, W.C.2.

Electricity Supply Progress During 1925.—Whilst, as the Electricity Commissioners remarked in their fifth annual report, considerable delay has resulted from the postponement of the Cabinet decision with regard to the Weir Committee's report, it would be very far wide of the facts to infer that no progress had been made during the year. Such an impression may cause hesitation amongst individuals in relation to schemes for electricity supply, and therefore it is worth while to demonstrate that such hesitation has not been shared by all parties.

For instance, it is satisfactory that the London and Home Counties Joint Electricity Authority has been established, and also that we may look forward to the setting-up of the West Midlands Joint Electricity Authority early in 1926.

In addition to these two Electricity District Orders, Parliament has also approved during the year over 20 Electricity Special Orders creating new undertakers, as well as numerous Electricity (Extension) Special Orders for existing undertakers. Whilst these were being approved, further applications were lodged by various authorised undertakers for extensions of their areas; and certain local authorities, companies, and persons have applied for statutory powers for electricity supply.

Apart from the (Extension) Special Orders which have been confirmed, and applied for, during 1925, the following are some of the new undertakers who have been added to the list during the year:—The Corporations of Calne, Clitheroe, Lichfield and Newark; the Urban District Councils of Ashford, Ashton-in-Makerfield, Bredbury and Romiley, Crediton, Grange, Guisborough, Padiham, Preesall, Prestatyn, Stanley, Tanfield and Ulverston; and the Rural District Councils of Penybont and Wirral; as well as several new companies.

The following are some of the would-be undertakers who have applied for powers during 1925:—The Corporations of Brecon and Richmond; the Urban District Councils of Bolsover, East Dereham, Gainsborough, Millom, Porthcawl, and Spalding; and the Rural District Councils of East Preston and Wrexham.

Fire. — Early in the morning of December 18th, fire destroyed the wireless experimental station of Capt. P. P. Eckersley, chief engineer of the B.B.C., at Hendon. It contained many data and much valuable short-wave apparatus, but was not officially connected with the British Broadcasting Co., Ltd.

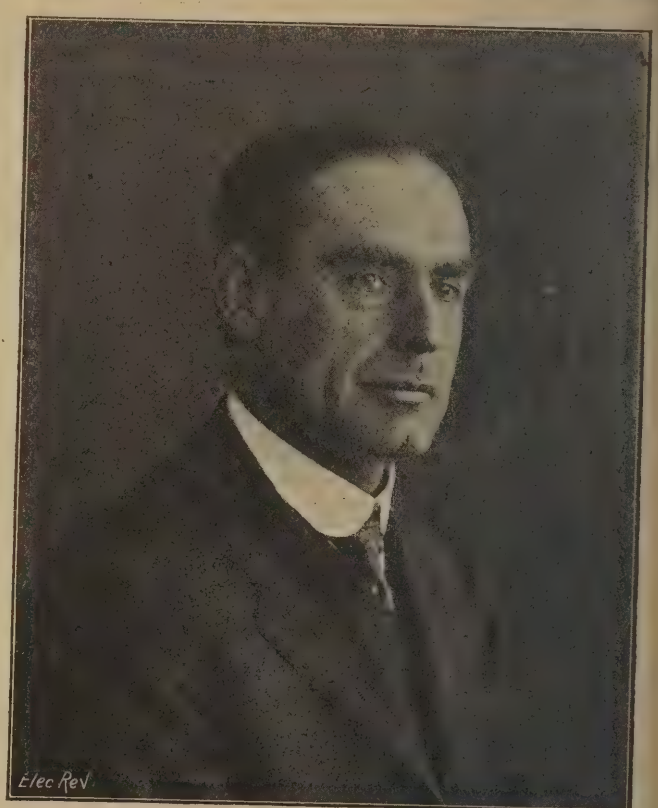
Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. PERCY HUNTER, Commonwealth Director of Immigration, has been appointed general manager in Sydney of the Pacific Cable Board. According to the *Daily Telegraph* "the staff have informed the Board that they possess complete confidence in Mr. Robert Sutherland Bain, who has been acting manager at the headquarters in Sydney for four years with conspicuous success."

Alderman Mrs. HAMMER, chairman of the Electrical Association for Women, has just been elected vice-chairman of the Hackney Electricity Committee. To her, therefore, belongs the distinction of being the first woman to hold such a position.

Mr. O. G. LEE, contract manager of the Liverpool telephone district, has been appointed district manager of telephones for the Southampton district.



Mr. W. HOWE, telephone manager of the Southampton district, on retiring from the service has been presented by the district manager's staff of the Hants. and Dorset district with an inlaid mahogany combined barometer and thermometer and a set of books. Mr. Howe has spent 45 years in the telephone service.

Stoke Newington Borough Council Electricity Committee recommends the payment to Mr. H. LARGE, acting borough electrical engineer, of £125 for extra duty performed by him during the absence of the borough electrical engineer up to November 30th. The Committee has appointed Councillor J. LITTEN chairman and Councillor C. F. HELLIAR vice-chairman for the ensuing year.

We read in the *Electrical World* that Mr. JAMES M. WAKEMAN, who was for many years associated with that journal as vice-president and general manager, and subsequently spent from 1910 to 1913 in quest of health, after which he held for eight years the position of general manager of the Society for Electrical Development, has just returned to the United States after an absence of 16 months travelling in England, Scotland, France, and Italy.

Mr. W. H. COLLIS, on retiring from the position of deputy resident electrical engineer to the Liverpool Corporation, has been presented with a silver salver. Mr. Harold Dickinson, city electrical engineer, made the presentation. He has been connected with the Corporation Electric Supply Department for 37 years.

We reproduce herewith a portrait of Mr. E. EDWARDS, chairman of the Tees-side Sub-Centre of the Institution of Electrical Engineers. Mr. Edwards was educated at the Oswestry Grammar School and the Municipal College of Technology, Manchester. He served an apprenticeship with the British Westinghouse Co., Manchester, and then joined the Kent Elec-

M. Wright] [*Middlesbrough*

Mr. E. Edwards,

Chairman of the Tees-side Sub-Centre of the I.E.E.

tric Power Co. Subsequently, for a period of 12 years, he was connected with the Cleveland and Durham Electric Power Co. and the Newcastle-upon-Tyne Electric Supply Co. He was then appointed chief electrical engineer at the Acklam works of Messrs. Dorman, Long & Co., Ltd., a position which he still occupies.

Brevet-Colonel E. ROBINSON, who has just retired from the command of the Tyne Electrical Engineers (Territorial Army), was associated with that corps for many years. He was commissioned more than 20 years ago in the regiment, got his captaincy in 1903, majority in 1911, and from second in command was promoted lieutenant-colonel commanding in June, 1916, and received his brevet step in February, 1921. Colonel Robinson holds the Order of the British Empire for his services during the late war.

The command of the above-named corps has gone to Lieut.-Colonel N. H. FIRMIN, O.B.E., promoted from major and second in command. Lieut.-Colonel Firmin was commissioned in 1909, was promoted lieutenant in 1911, captain in 1915, and reached field rank in 1916. He rendered very valuable services during the late war, which were recognised by the King conferring on him the Order of the British Empire.

The Liverpool University Council last week appointed Associate-Professor F. J. TEAGO, D.Sc., M.I.E.E., to the Robert Rankin Chair of Electrical Machinery.

Mr. P. K. TURNER has retired from his position as Editor of *The Wireless Trader* in order to take up an important appointment in the research department of Burndept, Ltd.

Mr. A. S. BLACK, who opened the Edinburgh sub-branch of the General Electric Co., Ltd., in 1920, has recently been appointed assistant Scottish manager at the Glasgow branch. Mr. Black has now spent fifteen years with the company.

Obituary.—SIR GEORGE GIBB.—We regret to record the death of Sir George Stegmann Gibb, which occurred on

December 17th at the age of 75 years. Sir George, who was born in Aberdeen, was articled to a solicitor, and he was appointed solicitor in 1882 to the North-Eastern Railway, of which in 1891 he became general manager, a position which he held until 1906, following as a director for the next four years. In 1903 he was a member of the Royal Commission on London Traffic, and in 1906 when he left the N.E.R. he came to London as chairman of the Metropolitan Railway and managing director of the Underground Electric Railways Co. of London, Ltd. This occupied Sir George until the year 1910, when he became chairman of the Road Board, an office which he held until 1919. He served the railway and national interests in many excellent ways both as an arbitrator on wage matters and as an organiser. He was created a knight in 1904.

MR. ERNEST BENEDICT.—We have to record the death, at the age of 87 years, of Mr. Julius Felix Ernest Charles Benedict, M.Inst.C.E. Mr. Benedict was engaged in connection with railway engineering work in India and in this country for very many years. He was subsequently connected with technical journalistic work and was secretary of the Tramways and Light Railways Association from 1901-1906.

MR. G. A. MILLER.—Mr. George A. Miller, chairman of Messrs. W. H. Willcox & Co., Ltd., of Southwark, passed away on December 13th in his 76th year, at his residence in London. Mr. Miller joined the firm of W. H. Willcox & Co., Ltd., some 40 years ago, after having been previously connected with Sir W. H. Bailey & Co., Ltd., of Manchester.

Ald. W. F. COOKE, J.P., Mayor of Nelson, whose death took place on December 16th, was an assiduous chairman of the Electricity Committee. His services as representative on the Mid-Lancashire Electricity Committee and the Mid-Lancashire Advisory Board were much appreciated.

Wills.—The late Captain M. H. P. RIALL SANKEY left £12,538 gross and £1,087 net personalty.

COL. SIR ADAM BECK, of London and Ontario, left £6,139 presumably in this country.

New Companies Registered.

Power Auxiliaries Co., Ltd. (210,404).—Private company. Registered December 16th. Capital, £7,500 in £1 shares (3,750 "A" and 3,750 "B" ranking *pari passu* in all respects as to both capital and dividend). Objects: To acquire the goodwill and trade marks of the Power Plant Auxiliaries Company, with or without any of the other assets of that business, to adopt an agreement with W. S. A. Backhouse, and to carry on the business of engineers, specialists in boiler efficiency, boiler makers, iron and brass founders, millwrights, machinists, manufacturers of cotton, flax, and hemp, rope and twine, wire and wire rope, electric cables and wire, metallurgists, electrical engineers, &c. The first directors are:—W. S. A. Backhouse, 116, Cheadle Road, Cheadle Hulme, Cheshire, engineer (permanent); P. Backhouse, Glendarnel, Thorley Lane, Timperley, Cheshire, merchant; A. F. Walker, "Glenferry," Regent Road, Altrincham, Cheshire, secretary. The holders of the "A" shares are entitled to appoint two directors, and the holders of the "B" shares shall, so long as W. S. A. Backhouse is a permanent director, be entitled to appoint one director, but when W. S. A. Backhouse ceases to be a permanent director, then the "B" shareholders shall be entitled to appoint two directors. Qualification of permanent director, 1,000 shares; of other directors, £100. Remuneration as fixed by the company. Solicitors: Addleshaw, Sons and Latham, 15, Norfolk Street, Manchester. Registered office: 1a, Marsden Street, Manchester.

Unique Wireless Co., Ltd. (210,330).—Private company. Registered December 12th. Capital, £5,000 in 4,800 10 per cent. preference shares of £1 and 4,000 deferred shares of 1s. Objects:—To adopt an agreement with W. H. Sayers, L. S. Allen, and A. B. Ferguson, and to carry on the business of manufacturers of wireless or radio apparatus, component parts, complete sets, dry batteries, accumulators and wet batteries, static eliminators, wave-meters, wave traps, aerials, valves or thermionic tubes, &c. The first directors are:—W. H. Sayers, 209, Croxted Road, West Dulwich, S.E., engineer; L. Sandeman-Allen, "Goose Green Cottage," Pirbright, Surrey, insurance broker; A. B. Ferguson, 5, Catherine Road, Surbiton, insurance broker. Remuneration as fixed by the company. Secretary: S. C. Warren.

Maldon Electric Works, Ltd. (210,444). — Private company. Registered December 17th. Capital, £7,000 in 5,000 5 per cent. cumulative preference and 2,000 ordinary shares of £1 each. Objects: To acquire the business of electrical and other engineers carried on by Cooper and Smith, Ltd. The subscribers (each with one preference share) are:—T. Cooper, Spring Valley, St. Albans, chartered civil engineer; L. G. Cooper, Redcliffe, Orpington, Kent, member of London Stock Exchange. L. G. Cooper signs as a director. Solicitors: Mackrell & Co., 21, Cannon Street, E.C.4. Registered office: Station Road, Maldon, Essex.

Collinge & Corrigan, Ltd. (210,341).—Private company. Registered December 14th. Capital, £1,000 in £1 shares. Objects: To acquire the business of electrical engineers now carried on by F. Collinge and J. G. Corrigan at Leicester Street, Southport, as "Collinge and Corrigan," and to carry on the same and the business of motor engine makers and dealers in wireless receiving sets and apparatus, &c. The permanent directors are:—F. Collinge, 83, Tithebarn Road, Southport; J. G. Corrigan, "Rodona," Moss Road, Halsall, near Ormskirk. Qualification, 100 shares. Remuneration as fixed by the company. Registered office: 7, Tower Buildings, Leicester Street, Southport.

Vincent Switchgear Manufacturing Co., Ltd. (210,331).—Private company. Registered December 12th. Capital, £10,000 in £1 shares. Objects: To acquire the business now carried on by F. W. Abbott at Sampson Road North, Birmingham, as "Vincent Switchgear Manufacturing Co.," and to carry on the business of manufacturers of switchgear and electrical accessories, mechanical engineers, electricians, &c. The subscribers (each with one share) are:—F. W. Abbott, Sampson Road North, Birmingham, electrical engineer; Miss M. L. Abbott, "Rutherglen," Church Road, Yardley. F. W. Abbott is the permanent governing director. Solicitors: Huggins & Co., 63, Temple Row, Birmingham.

Watson Jones, Ltd. (210,435).—Private company. Registered December 17th. Capital, £10,000 in £1 shares. Objects: To adopt an agreement with H. R. Watson, A. E. Jones, and W. G. Bowditch, and to carry on the business of dealers in electrical, wireless and scientific goods and instruments as formerly carried on by the said parties at St. Stephen's House, Victoria Embankment, Westminster. The first directors are:—H. R. Watson, 33, Effra Road, Wimbledon, S.W., engineer (managing director); A. E. Jones, 33, Effra Road, Wimbledon, S.W., engineer; W. G. Bowditch, 1, Chatsworth Gardens, Acton Hill, W.3, merchant; F. C. Eckford, 39, Foulser Road, Tooting, S.W.17, engineer, each of whom may retain office for seven years. Qualification, £50. Remuneration, £5 per annum. Registered office: 22, St. Stephen's House, Westminster, S.W.1.

Passmore, Gilhome & Co., Ltd. (210,364).—Private company. Registered December 14th. Capital, £300 in £1 shares. Objects:—To contract for and undertake the erection of buildings of all kinds, to manufacture or supply electrical and mechanical plant, to act as constructional, electrical and mechanical engineers, builders, and agents or representatives of any British, Colonial, or foreign electrical, constructional, or general engineers, &c. The permanent directors are:—R. P. Steyther, 17, Elmers End Road, Anerley, S.E.20, gentleman; A. G. Spence, 7, Thicket Road, Anerley, S.E.20, electrical engineer. Solicitors: Macdonald & Stacey, 2, Norfolk Street, Strand, W.C.2.

Radio Valves, Ltd. (210,351).—Private company. Registered December 14th. Capital, £500 in £1 shares. Objects:—To carry on the business of manufacturers of, and dealers in wireless apparatus, accessories and appliances, electrical engineers, &c. The subscribers (each with one share) are:—R. Roots, 19, Holmesdale Avenue, East Sheen, S.W.14, solicitor: E. G. Hake, Hotel St. Kilda, Torrington Square, W.C. The first directors are to be appointed by the subscribers. Qualification, 1 share. Remuneration as fixed by the company. Solicitor: R. Roots, 19, Holmesdale Avenue, East Sheen, S.W.14. Registered office: 3, Cross Lane, Eastcheap, E.C.3.

Official Returns of Electrical Companies.

Wholesale Electrical Company (1922), Ltd. — G. Farquhar, of 64, Victoria Street, S.W.1, ceased to act as receiver or manager on March 26th, 1925. (Notice filed December 11th.)

Frome Engineering Co., Ltd.—S. M. Pettitt, of 16, Albemarle Street, W.1, C.A., was appointed receiver and manager on December 8th, 1925, under powers contained in debentures dated July 28th, 1923, and September 10th, 1925.

Herbert Ward, Ltd.—Mortgage dated June 15th, 1925, to secure £1,164, and further advances, charged on 61-73 (odd numbers), Fernlea Road, Tooting. Holders: Halifax Permanent Benefit Building Society. (Registered December 9th, by permission of the Court.)

Burton & Tweedy, Ltd.—Satisfaction in full on December 9th, 1925, of debentures dated July 31st, 1923, securing £1,000.

W. S. Laycock, Ltd. (in liquidation).—Satisfaction on or before November 28th of mortgage or charge dated May 5th, 1925, securing the remuneration of the receiver and manager and payment of all debts, liabilities and obligations, if any, properly incurred or undertaken by him.

Rural Electricity Supply Co., Ltd. (107,281).—Capital, £10,000 in 9,500 preferred shares of £1 each and 10,000 deferred shares of 1s. each. Return dated November 14th, 1925. 5,512 preference and 5,713 deferred shares taken up. £3,269 9s. 3d. paid on 2,871 preference and 5,713 deferred shares (including £112 16s. 3d. paid on 205 forfeited shares). £2,641 considered as paid on 2,641 preference shares. Mortgages and charges, nil.

Simplex Conduits, Ltd. (88,290).—Capital, £100,000 in 50,000 ordinary shares of £1 each and 10,000 preference shares of £5 each. Return dated November 3rd, 1925. 40,000 ordinary and 10,000 preference shares taken up. £50,000 paid on the preference. £40,000 considered as paid on the ordinary. Mortgages and charges, nil.

Electric Car and Accessories Co., Ltd.—A. V. Chetland, of 16, Portobello Road, W.11, was appointed receiver on December 7th, 1925, under powers contained in debenture dated November 21st, 1920.

General Electric Co., Ltd.—Satisfaction to the extent of £42,900 on November 5th, 1925, of debenture stock dated July 22nd, 1921, securing £3,500,000.

Montevideo Telephone Co., Ltd. (27,208).—Capital, £220,000 in £1 shares. Return dated November 9th, 1925. 217,135 shares taken up. £217,135 considered as paid. Mortgages and charges, nil.

Vactite Wire Co. (1919), Ltd. (156,012).—Capital, £25,000 in £1 shares. Return dated December 3rd, 1925. 15,000 shares taken up. £3 paid. £14,997 considered as paid. Mortgages and charges, nil.

Price's Electrical Supplies, Ltd. (175,260).—Capital, £3,000 in £1 shares. Return dated October 16th, 1925. 1,210 shares taken up. £1,210 paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Edison Swan Electric Co., Ltd.

The annual meeting was held on December 16th, Mr. C. F. Spencer (chairman) presiding. In presenting the report and accounts, which were reviewed in our issue of December 11th (p. 946), the chairman said that the authorised capital of the company was £432,565, of which £141,130 was in £1 shares. It was proposed to divide those shares into 4s. shares each, in order that all ordinary shares would be of one denomination. The articles of association also needed revision. There was outstanding on June 30th last £248,579 of first debenture stock and £55,034 of second debenture stock, whilst £200,000 of the latter stock was lodged with the company's bankers as security for a loan. During the current year the board would probably endeavour to consolidate the remaining first and second debenture stock and thus effect a reduction in loan charges. The debenture stock sinking fund showed a credit balance of £7,834, which would be appropriated to the redemption of debentures. Their bankers, the National Provincial Bank, Ltd., had been of great assistance to them during the three years in which they had been reorganising the company. The amount owing to the bankers was £110,000; when the present board took office a little over three years ago it was £314,150. They had reduced the long-term first and second debenture stock debt by £26,606. The reserve account was to be augmented to the extent of £50,000, making £130,000 in all. In pursuance of its aims, the board had in effect discharged debt to the extent of £230,756, which would be augmented shortly by further utilisation of sinking

funds; and it had created a reserve account of £130,000, which could not be considered entirely inadequate. The sum carried forward represented an increase of £11,701. In augmenting the reserve account and carry forward, they were endeavouring to consolidate the finances of the company. The reserve account was invested in the business, but the board would not be satisfied until it was invested in gilt-edged or other sound securities. The book value of patents, goodwill, &c., had been reduced by £26,606, and they hoped to pursue a consistent policy of reduction until it reached a figure of more reasonable dimensions. Their goodwill was sound. Their lamps were British made, and the quality was excellent. The glareless "Fullolite" lamp had become a favourite, and their radio sets and valves were well known. Regarding the trading position during the current year, the chairman said that their profits to November, 1925, were quite satisfactory, and they were getting a reasonable share of the trade available. What he had said indicated that the company was travelling along the road to prosperity, but he could not refrain from saying that there was a factor which might react unfavourably upon the company's fortunes, in common with those of others engaged in a similar class of business, with little chance at present of their being able to combat it. He referred to unrestricted and relentless foreign competition. Many of the products which they manufactured were subject to competition from abroad, against which they were almost powerless. Depreciated exchanges were in the nature of a bounty to the foreign producer; taxation in the countries of their foreign competitors was on a lower basis than national taxes and local rates in this country; we were paying the interest on our National Debt, which included the war debts due from foreign countries. German producers, owing to the policy of inflation, were almost compelled, in order to prevent their liquid resources and credit becoming valueless, to utilise them in the purchase of fixed assets, including plant and machinery of the latest type, and in this manner German producers had been able, at a small capital cost, to install the most modern methods of production, and were thus able to produce at very low prices; and the hours worked per week per operator in some foreign countries were greater than in this country, with a result that the weekly output was higher and the cost of labour in time per unit of product was less than ours, and lower wage rates were paid. Apart from those factors, the standing charges of the foreign manufacturer were much less per £100 of wages paid than those of the British manufacturer as general expenses abroad were on a much lower scale. There were many difficulties in trading with open doors and without retaliatory weapons. Turning to the brighter side, Mr. Spencer said that the Treaty of Locarno was bound to help in the restoration of confidence in Europe and confidence, after all, was the backbone of trade. The return to the gold standard and the subsequent raising of the ban on foreign issues of capital was also satisfactory, as part of our national products in pre-war days could only be sold abroad if the purchaser was lent the money to pay for them, and this was still a fact to-day. Thus there were signs of improvement, but he was apprehensive as to the nullifying effect of relentless foreign competition. The subject was one of increasing importance to the wage earner, who could not afford any more than the employer to have his livelihood so assailed, and he looked forward to the time when the worker and the employer would co-operate to prevent the entry of foreign goods, produced not on a commercial scale or basis, but on what one might term an ultra-subsidised production basis.

The report and accounts were adopted, and a resolution to grant the chairman a sum of £5,000 in recognition of his services was unanimously approved. At a subsequent extraordinary meeting resolutions were passed altering the articles of association and dividing the unissued ordinary shares, as mentioned by the chairman in his speech.

Cape Electric Tramways, Ltd.

Mr. L. Breitmeyer (chairman) presided at the annual meeting on December 16th, and in presenting the report and accounts (which were reviewed in our issue of December 11th, p. 946), he said that, although South Africa had suffered from general business depression, and the company's earnings had been affected, in the last four months of the year a decided improvement had taken place, so that upon the whole very little variation had resulted. In Cape Town there had been a slight decrease in the number of passengers carried, and a consequent decline in the revenue. In Port Elizabeth, although the number of passengers had increased, there was a slight decrease in the receipts. The profit brought into the accounts from South Africa was £94,222, as against £95,454. The 6 per cent. debenture debt had been wholly redeemed, relieving the company of an annual charge of £25,778. It had been decided, however, to extend the term of repayment of the outstanding 5 per cent. debentures over a period of ten years. As stated in the report, neither the Port Elizabeth nor the Cape Town Municipalities had decided to expropriate the company's systems in their towns. About £100,000 would have to be expended upon track renewals and the purchase of additional plant and rolling stock during the next two years, but this expenditure would eventually prove remunerative. Cape Town was undoubtedly growing and with normal trade conditions the company's business was likely to increase considerably. In Port Elizabeth the traffic had been maintained in spite of motor-bus competition.

A final dividend of 4 per cent., free of tax, has been declared, payable on January 1st, 1926.

British Columbia Electric Railway Co., Ltd.

Brief mention of the report of this company for the year ended June 30th last was made in our last issue. Supplementing this we may say that the profit of £360,792, after paying debenture interest, &c., plus £60,471 brought forward, making £421,263, was distributed as follows:—Preference and preferred ordinary dividends, the latter totalling £6 6s. 9d. per cent., free of tax, and a total dividend of £8 per cent., free of tax, on the deferred ordinary, absorbing together £320,373; £40,000 was transferred to the general reserve in respect of expenditure on underground cables; and £60,890 is carried forward. During the year the sum of $4,503,908 was expended on additions to the power-generating plant and transmission systems, on new rolling stock, and in extensions of the lighting, power, and gas systems. The work of installing the fifth set at the Stave Falls power house has now been completed and with the installation of the new switching apparatus now nearing completion the plant will be one of the most modern and efficient in the country. The construction at Alouette Lake is progressing satisfactorily, the tunnel connecting Alouette Lake with Stave Lake having been completed in May, 1925. On completion of the Alouette plant (13,400 h.p.), the total capacity of the company's stations will be 212,200 kW. The Bridge River Power Co., which owns water rights on Bridge River adjacent to the Pacific Great Eastern Railway and near the town of Lillooet, has been acquired. A favourable report on the property has been received but little will be done there before 1927. As the result of the establishment of new industries, house-building, and the increased use of electrical appliances, the energy sold during the year amounted to 322,656,645 kWh, as compared with 298,872,146 kWh in 1923-24. The number of consumers served rose from 80,793 to 84,587 and the motors connected from 96,815 h.p. to 99,990 h.p. A reduced rate based on the maximum demand principle has been instituted in Vancouver; this is expected to encourage the more liberal use of electricity. The contract with the Puget Sound Power & Light Co. expires next March, but although this will effect the company's revenue the general increase in business is expected to compensate for the loss. Street traffic continues to expand, the number of passengers carried having risen by 1,526,841 to 69,779,475. The amount of freight hauled rose from 355,384 tons to 371,634 tons, and there is a prospect of a further increase during the current year. Negotiations for the continuance of the present street railway fares came to a successful conclusion. The sales of gas and the number of consumers showed satisfactory increases. The properties of the company are stated to be in excellent condition. The annual meeting was to be held on Wednesday last (December 23rd).

Venezuela Telephone and Electrical Appliances Co., Ltd.

The annual meeting of this company (whose report was reviewed in our issue of December 4th, p. 909) was held on December 15th. Mr. J. S. Austin (chairman), who presided, said that there was reason for satisfaction at the result of the past year's working. Although they were paying the same dividend (8 per cent.), he felt that this was not large enough, but there was a reason for it. The company contemplated further capital expenditure and a further issue of capital. This expenditure for some time would be unremunerative, although dividends would have to be paid on the capital. The new section which was being added to the Caracas switchboard would be on the automatic system; this would be the first step in the conversion of the whole of Caracas to the automatic system. The new capital would be offered to the shareholders, and equal amounts of preference and ordinary shares would be offered at the same time, and the shareholders would be required to subscribe in equal amounts for the two classes, as there was such a very close connection between the two shares. The preference shares were entitled to a cumulative dividend of 8 per cent., and when that was paid the ordinary shares would receive 8 per cent., and after that the two shares would rank equally. The issue would probably be made either in June or December of next year. The report and the accounts were adopted, and at a subsequent extraordinary meeting the board was empowered to increase the capital to £280,000 by the issue of 70,000 each of £1 preference and ordinary shares. It was explained that the new capital would not all be issued at once; the first instalment would probably be £100,000.

The Vickers Reorganisation Scheme.

The proposals for reducing the ordinary capital, &c., outlined in our last issue, p. 989, came before an extraordinary general meeting at Sheffield on December 17th. Mr. Douglas Vickers, who presided, introduced the report of the company's advisers, and spoke at some length upon the circumstances which had led up to their appointment. He said that the losses were mainly due to the fact that after the war they had large armament factories upon their hands. Some of these had been successfully converted into producers of peace-time necessaries, but in some directions this policy had not been successful. In 1919 they had taken over the control of the British Westinghouse Co., in association with the Metropolitan Carriage, Wagon & Finance Co., hoping that the earnings of the electrical department would allow them to bridge over the period during which it was obvious that armament orders could only be small. Unfortunately for the company, the Washington Conference reduced programmes to a minimum, and restrictions of facilities for loans in this country led to orders being placed in France.

The electrical interests were doing reasonably well. The Metropolitan Carriage Co. and its subsidiaries had been, and were paying steady dividends, although not so large as they had anticipated. Mr. Vickers went on to deal with other branches of the group, and explained the resolutions. Mr. R. McKenna, one of the advisers, also addressed the meeting, and after some discussion, during which an amendment to defer consideration of the recommendations was proposed, the resolutions were adopted, the chairman agreeing that the shareholders should be represented on the Advisory Committee.

C. A. Vandervell & Co., Ltd.—The directors have issued a balance-sheet showing the results of the past two years' trading (to March 31st last). This shows a loss of £130,624 in 1923-24 (as compared with £18,111 in the preceding year) and a profit of £20,316 in 1924-25. It is considered that a drastic reorganisation is necessary. Since the date of the accounts, savings amounting to £118,768 have been effected by settlements in respect of outstanding loans. An offer has been made to the shareholders for the purchase of the whole of the preferred and deferred ordinary shares at the prices of 12s. 6d. and 2s. 6d. per share respectively. The directors advise the acceptance of the offer, stating that they are willing to dispose of their own holdings at these prices.

Marconi International Marine Communication Co., Ltd.—The directors state in a circular that it has been their practice to declare an interim dividend at about this period of the year. They do not feel, however, in view of the operators' strike, that they are justified in paying an interim dividend. As soon as the strike is ended they will reconsider the matter and, if possible, will pay an interim dividend of 2½ per cent. The circular says that British shipping has been passing through the most serious crisis in its history and the directors are confident that, before very long, the great majority of the wireless operators will realise that, in the interests of their industry, there is no alternative but for them to accept the reductions which are already in operation with every other class of seafarer.

Lima Light, Power and Tramways Co.—It is proposed to reorganise the capital of the company by the writing down of the ordinary shares from £P1,500,000 to £P750,000, and the issuing of new ordinary shares. The necessity for this action arises from the losses due to severe floods in the early part of the year. The preference shares and the 6 per cent. mortgage debentures issued in London a year or two ago are not affected by the scheme, being well secured.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted :—

Brisbane Tramway Trust.—Stock and partly-paid scrip for £500,000 5½ per cent. Brisbane Tramway stock, 1944-1954.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Foundation Co.—10,000 8 per cent. participating preference shares of £1 each, fully paid, Nos. 129,503 to 139,502.

A. J. Stevens & Co. (1914), Ltd.—At an extraordinary general meeting held on December 15th, it was decided to increase the company's capital to £600,000 by the creation of 100,000 cumulative preference and 150,000 ordinary shares of £1 each.

French Company.—*Société l'Electro-Câblé.*—The directors have declared a dividend of 8 per cent., and report that the great fluctuation during the year in the purchasing power of the franc had led buyers to restrict their orders to a marked extent.

Pinchin, Johnson & Co., Ltd.—A dividend at the rate of 6½ per cent. has been declared on the preference shares for the half-year ending December 31st.

Manila Electric Co.—A dividend of 50 cents per share has been declared on the common stock for the quarter ending December 31st.

Lisbon Electric Tramways, Ltd.—The dividend on the 6 per cent. cumulative preference shares has been declared for the year ending December 31st.

International Light and Power Co.—Dividend of 3 per cent., less British tax, on preference shares for six months to December 31st.

Shawinigan Water and Power Co.—A dividend of $2 per common share has been declared for the quarter ending December 31st.

Cawnpore Electric Supply Corporation, Ltd.—The dividend on the 7 per cent. preference shares for the current half-year is to be paid on December 31st.

Ferguson, Pailin, Ltd.—The directors have declared a final dividend of 9½ per cent. actual, making 13 per cent. for the year.

Canadian General Electric Co., Ltd.—A dividend of 1¾ per cent. on the preference shares for the quarter ending December 31st is announced.

Mackay Companies.—A quarterly dividend of 1¾ per cent. has been declared on the common stock.

Howard & Bullough, Ltd.—A quarterly dividend of 6d. per share is announced.

Bell Telephone Co. of Canada.—The usual quarterly dividend of 2 per cent. has been declared.

Stocks and Shares.

MONDAY MORNING.

STOCK Exchange markets enter with a bold and courageous air upon the Christmas week. Bargains are now being done for settlement on January 7th, 1926, and the knowledge that they need put up no money until the year has turned is a stimulus to purchasers. Nor is any fear now entertained, as it was last week, of a possible rise in the Bank rate. Money conditions have become easier, and the outlook, viewed with apprehension so recently, is regarded with composure. New issues attract favourable attention, and the Stock Exchange has a clear conscience in wishing its clients a merry Christmas, with a prosperous New Year to follow.

The same traditional good wishes may be offered by anyone who writes upon the course of prices and developments in connection with electrical companies' stocks and shares. It is unhappily true that the year has been a bad period for holders of Home Railway securities. But in most of the other sections with which these weekly letters deal, the year now ending has seen a notable addition of strength to share values, and the price lists of to-day maintain the general trend of the past twelve months.

Kensington Electric Supply shares have risen to 13¼. Metropolitans are a florin up, at 40s. 6d. St. James's and Pall Mall put on 2s. 6d., Westminsters 6d., and South Londons 1s. 3d. London Electric preference weakened to 5½, and County of London ordinary reacted to £3 after the vivid rise in the price last week. Richmond Electrics have advanced to 30s. Egham and Staines new ordinary are firmer at 22s. 6d. Midland Counties new ordinary are changing hands at 22s. 3d., and the 6 per cent. new preference mark 20s. 6d. New Lancashires are 2s. premium for the ordinary, and a slightly higher price is bid for the preference. Yorkshire Electric new ordinary are being dealt in on the basis of 29s. Electrical Distribution of Yorkshire stand at 35s., and the partly-paid new shares at 5s. 9d., a premium of 3s. 9d. Kensington 5 per cent. Second Preference were done the other day at 4⅞ and 4 5/16ths. County of London new preference remain at about 22s. 6d. The rubber market excitement aroused a little demand for Anglo-Dutch Utilities 6 per cent. guaranteed debenture stock, now priced at 102.

Barcelona Tractions continue to be a fairly active market: the price is 31. Brazilian Tractions yielded a couple of their last week's rise of 7 points, the current price being 83. Anglo-Argentine Tramways first and second preferences are both ex dividend, allowing for which the prices show ⅛ fall in each case. The outstanding feature in this department is a jump of 6½, to 121½, in British Columbia Electric Railway deferred stock. Some of the demand is reported to be for account of Canadian buyers. No alterations have taken place in British Electric Traction, or in the London traction issues.

The Marconi Marine Company has postponed payment of an interim dividend, owing to the recent strike of operators. The directors state, however, that they will consider the matter, and, if they feel justified in so doing, will pay an interim dividend of 2½ per cent., which would compare with 5 per cent. a year ago, the full dividend for the year being made up to 7½ per cent. The shares are a dull market at about 17s., and Marconis are 22s. 6d. sellers. Other wireless shares exhibit a tendency to droop.

Equipment shares keep steady. Cromptons are the best spot, with a rise to 16s. 3d. The company is said to be doing well, and to be well supplied with orders. English Electrics weakened to 18s. 6d. Johnson & Phillips have been well maintained, and the market is very firm as a whole. The engineering list, with iron and steel shares, is stronger, by reason of the speeches made at last week's meetings of the Vickers and the Dorman Long companies. Evidence of substantial savings upon this year's coal bills by the railway companies was given before the Coal Commission by Sir Ralph Wedgwood, and led to advances in Home Railway stocks. On balance, no net change has occurred in the Undergrounds, but the prices had been flat before Sir Ralph Wedgwood's statement, and the falls have been recovered. Metropolitans, for instance, had been down to nearly 68 before they rallied to 69.

Great Northern Telegraphs are £1 lower at 33. Western Telegraphs and Globe ordinary have risen 5s. apiece. Automatic Telephones are unchanged at 51s. 3d. United River Plates continue their advance, being now up to 7¾. The industrial list remains rather overshadowed by the activity of the rubber market, in which latter a shake out, due to an abrupt drop in the price of the product, was followed by sharp improvement in sympathy with a rise in raw rubber. Share prices are again on the mend, and the interest of the public in the popular market of the moment is as keen as ever.

The Coal Commission.—RAILWAY ELECTRIFICATION.—"I do not think, looking over the next ten years, that the Commission need seriously consider the question of main-line electrification," said Sir Ralph Wedgwood, chief general manager of the L. and N.E. Railway, and chairman of the General Managers' Conference, 1925, when giving evidence before the Coal Commission. Sir Ralph's remark was made *apropos* the railway's consumption of coal. He added, says the *Daily Mail*: "If the cost of power were reduced and the progress of invention in some way cheapened the price of generating electricity or of the plant required for the electrification of lines, then you might see some change." Sir Ralph said that, compared with the average pit-head prices paid in 1911, coal cost the four grouped companies approximately £9,250,000 more in 1924.

"The Times'" Time.—A new bracket clock has been erected on the Queen Victoria Street frontage of *The Times* building; it is a handsome reproduction in bronze, copper, and opal of the paper's well-known emblem, the open book, flanked by the closed volumes *Times Past*, *Times Future*. The clock, according to the *Horological Journal*, is operated on the Synchronome system; the hands are driven by an electromagnet applied to the motion work behind the centre of each dial, the simple movement being so small as to be concealed by the central bosses. The entire space between the dials is available for illumination, and by the device known as "detachable centres" the central opal panels which carry the movements and hands can be readily drawn inwards, thereby providing access to all parts of the clock. One can open the window and step on a platform between the brackets, open the door in the case, and walk into the space between the dials, when lamp changes and cleaning, inside and out, can be carried on in comfort. The work has been carried out by the Synchronome Company, Limited, under the supervision of Mr. F. Hope-Jones.

Exports and Imports of Electrical Goods and Machinery in November, 1925.

It will be seen from our table of last month's exports that there was a further decline, though not so large as that which occurred in October. Two items were mainly responsible for the decrease, *viz.*, "Other motors and generators" and submarine telegraph and telephone cable—the latter being the most variable of the items which make up the list. There were only six increases, and none of these was of great consequence, unless we except the rise of £11,005 in the value of exported glow lamps. As compared with November, 1924, the position is even less favourable. Five items show serious falls—railway and tramway motors, other motors and generators, the two telegraph and telephone cable sections, and telegraph and telephone instruments and apparatus—and these are only partly balanced by fairly substantial increases in insulated wires and cables, and glow lamps. Thus the excess of this year's over last year's imports has been further reduced, although it is now certain that the complete figure for 1925 will be higher than the 1924 total.

The imports also showed a decline as compared with October, although this amounted only to about 2 per cent., as against about 7 per cent. in the case of exports. The decrease was due to a large fall (£21,454) in imports of insulated wires and cables, which was partly offset by a rise of £12,992 in the case of unenumerated electrical machinery. In comparison with November, 1924, imports showed a rise of £46,904, the effects of a decline of £40,993 in telegraph and telephone instruments being nullified by large increases in unenumerated electrical goods and apparatus (£20,371), and batteries and accumulators (£44,118). There was only one decrease apart from that already mentioned.

The re-export section exhibits a series of decreases as compared with the previous month's figures, there being only two rises recorded. On the other hand, comparison with November, 1924, reveals principally increases.

Electricity Supply Development.

SIR HARRY RENWICK, K.B.E., presided at the annual meeting of the Provincial Electric Supply Association of the United Kingdom on December 17th, and in reviewing the work of the past year said that considerable progress had been made in the re-organisation of electricity supply. The Association had taken an active part in the framing of legislation affecting the industry. He considered that there was an urgent need for a revision of the regulations governing the use of overhead lines, as only by this means would it be possible to supply cheap electricity in rural areas. The progress made since 1920 was very encouraging, the combined output of all generating stations in the United Kingdom having increased by 43 per cent. in four years. There was no doubt that future progress would be more rapid as new fields of development were being opened up, and there was a tendency to remove many restrictions which had hitherto hampered the industry. He regretted the long delay in the publication of the Weir Committee's report; this was holding up a number of schemes of development, but it was to be hoped that when the report was issued it would be found that it was of a helpful nature. With wider legislative and financial facilities to assist in opening up and developing new fields of supply, and the prospect of increased efficiency of generation, he considered that a still brighter and more prosperous future lay ahead for the industry. Sir Harry Renwick made reference to an article which had appeared that week in the daily Press, which, he said, created false and erroneous impressions. Electricity supply was a highly technical matter, and amateur critics who compared conditions here with those in America were liable to make many mistakes. It had been disproved that pit-head generating stations could possibly solve the problem of cheap electricity; there were many other things besides coal supplies which had to be taken into consideration. Many capital stations in this country operated at a much higher efficiency than similar undertakings in America, and we had even supplied some of America's most efficient plant. The rates for power in Great Britain compared very favourably with those prevailing in America; in many cases, indeed, they were even lower. In conclusion, the chairman paid a tribute to the work of the Electricity Commissioners, and said that the problem of electricity supply was fully understood by both engineers and industrial leaders in Great Britain.

The Electrical Exports of Sweden.

The Figures for 1923 and 1924 Compared.

The following figures showing the exports from Sweden of electrical goods, machinery, and apparatus in 1924 are extracted from the recently-issued official trade statistics. The figures for 1923 have been added, together with notes of increases and decreases :—

	1923. Kr.	1924. Kr.	Inc. or dec. Kr.
Accumulators and parts thereof—			
Unmounted cells :			
Total	183,000	91,000	− 92,000
To Netherlands	3,000	*	—
,, Great Britain	146,000	44,000	− 102,000
,, United States	1,000	*	—
Accumulator plates :			
Total	282,000	115,000	− 167,000
To Denmark	60,000	12,000	− 48,000
,, Netherlands	214,000	99,000	− 115,000
Cells and batteries :			
Total	571,000	1,030,000	+ 459,000
To Netherlands	22,000	19,000	− 3,000
,, Great Britain	367,000	386,000	+ 19,000
,, Japan	*	202,000	*
Switchboards, fitted—			
Total	407,000	286,000	− 121,000
To Denmark	48,000	24,000	− 24,000

Reviews.

Time Standardisation of Workshop Operations. By T. PILKINGTON, M.I.Mech.E. 8½ in. by 5⅝ in. by ⅞ in. Pp. x + 253; fully illustrated. London: Sir Isaac Pitman and Sons, Ltd. Price, 16s. net.

It has long been recognised that the system of wages still so extensively employed in the majority of industrial establishments, based merely upon the number of hours which a man spends in the works is unsatisfactory both from the point of view of the workman himself and that of his employer. To the former it means that he reaps no reward for either ability or hard work, while to the latter it involves the payment of wages often far in excess of those actually earned, with the result that manufacturing costs are too high and contracts are lost. Many systems have been proposed whereby these obvious evils can be eliminated, such as the piecework system and the premium bonus system, but all of these must fail unless an exact estimate is made of the actual work involved on any particular job and an accurate idea is formed of the time which a workman or a gang of average ability should take to perform it. It is on this question of "time setting" that many piecework systems break, since nothing is more unsatisfactory to the men than to feel that they are being called upon to do more than was originally intended or to do it in a shorter time, and from the works manager's point of view it is equally unsatisfactory to find that a job can be performed in considerably less than the estimated time. Thus, the whole problem of a rational system of wages, including the exact determination of the productive capacity of the workers and of the manufacturing plant, may be said to be based upon the correct determination of the time standards for the various operations and this in its turn involves the training of the *personnel* of the time setting department to determine such time standards with an exact knowledge of the amount of work involved on each job, the capacities of the various machines to which it will pass and the average capabilities of the men who will carry out the work. It must be at once admitted that the task of training the time setters to the efficient performance of their tasks is no easy one in view of the varied nature of the work involved.

In the book under review, an attempt has been made to lay down the scientific basis of the determination of time standards. It is based upon the author's experience of this kind of work both in the United States and in this country, and it is of interest to note that he has been engaged chiefly in electrical work, so that the examples chosen represent up-to-date practice in electrical shops. His aim, however, has been rather to state the principles underlying the fixing of time standards and to describe the methods whereby such standards are fixed so that, although the examples chosen refer particularly to electrical practice, they can be applied with confidence to any operations in other industries. The book is divided into twelve chapters, the first two of which may be regarded as introductory, dealing as they do with the general problems of time standardisation, its aim and objects, and so on. In the third chapter the problem of fixing the time standards is studied in detail, the question of the various forms and charts required is dealt with and the relationship of the system to the workmen is discussed. This point is of great importance since the sympathetic co-operation of the workers is essential to success. Thus we heartily endorse the suggestion of the author that in addition to instructing the workers in efficient methods, attention should always be paid to any suggestion or complaints. In the next four chapters the question of formulæ, instruction cards, fixing of speeds and feeds of machines and the general routine of the time standards department is discussed, including the final problem of fixing the bonus charts for the individual workmen, for the gang, or even for the department. The question of setting the limits of time for any particular job is dealt with and it is of interest to note as indicating that the principle of time standardisation does not necessarily tend to reduce the man almost to the level of the machine he operates as is so frequently urged against the system, that the ethics of the problem is referred to, the question of charging time rates is discussed and the means whereby both the exceptional and the incompetent workman may be dealt with to the complete satisfaction of both is dealt with. In the remainder of the volume, the author discusses such problems as cutting-tool data, grinding practice, assembling, &c., giving many useful tables and other valuable information in so doing. This part of the work may be necessary as indicating the method of fixing the time for various operations, but at best it can only give a comparative idea since the equipment and facilities of different shops may vary between wide limits. Finally, we have a long chapter on incentives which we suggest might well have been placed before the chapters on cutting-tool data, &c. After all, the justification of time standardisation may be said to be based upon the idea that if the incentive is strong enough, human nature is such that the men will be eager to put forth the greater effort required. Thus production is increased, costs are lowered, and the greatest drawback of our present wage system, its failure to yield any incentive or to reward merit, is eliminated. And once the time standard has been adequately determined, then the question of incentive must at once be faced. Nevertheless, the author is to be congratulated upon having put into the pages of a single book the accumulation of knowledge of this important subject which hitherto has only been more or less scantily dealt with from time to time in the commercial and technical Press. It is, we believe, the first book published in this country which deals with the time analysis of manufacturing operations in a scientific manner, and it should be studied by all works managers, estimators and production engineers who are anxious to increase the productivity of their works and at the same time to raise the status of the men whom they employ.

The Mechanical Design of Overhead Electrical Transmission Lines. By E. T. PAINTON, B.Sc. Hons. (Lond.), A.M.I.E.E. Pp. viii + 274; figs. 189. London: Chapman & Hall, Ltd. Price 21s. net.

This book is a companion volume to "The Electrical Design of Overhead Power Transmission Lines," by Messrs. William T. Taylor and R. E. Neale, and the two together form a complete treatment of the design of this class of apparatus.

The book opens with a discussion of the various materials employed both for plain and composite conductors, the first chapter being devoted to tensile strengths, moduli of elasticity, distribution of stress in composite conductors, and other similar problems in strengths of materials.

The two following chapters deal with problems in connection with sag and stress, and with the design of supports. The mathematical treatment of sag problems is somewhat complicated and the author has done well to include alternative graphical methods. In the case of the chapters on supports the mathematical treatment is somewhat less involved. This is perhaps justifiable as, in the case of steel supports, such treatment would be more applicable to a treatise on "Theory of Structures." It is, however, a pity that the author has not gone a little more fully into the choice of steel supports, although such a question is essentially of a controversial nature.

Chapters V and VI deal respectively with wood and steel supports. In passing, it is a little difficult to understand why these chapters have been separated from Chapter III, also on supports, by a chapter on insulators. These two chapters deal very effectively with the design of supports and the calculation of stresses. The question of foundations is also fully discussed.

Chapter IV deals with insulators, and gives a brief *résumé* of the various types employed. Methods of manufacture are described, together with the tests to which insulators should be subjected.

The two remaining chapters deal respectively with constructional details and erection. The former chapter gives various methods of attaching conductors to insulators, forming joints, guarding, and protecting against transient disturbances due to lightning, while the latter deals with the many practical problems involved in the erection of a line.

The book is excellently produced and well illustrated, and although dealing with a highly specialised subject, contains much that is of general interest.

To those directly interested in overhead line construction it should be of great service, and in conjunction with the companion volume it is a valuable addition to any technical library.

Wireless Questions and Answers. By P. J. RISDON, F.R.S.A. Pp. 92; figs. 40. London: W. Foulsham & Co., Ltd. Price 1s. net.

This little book consists of 288 questions with answers in wireless telegraphy and telephony, referring almost entirely to simple receiving circuits and the elementary theory of electricity.

It is especially suited to the needs of the amateur who so often gets rather "fogged" by trying to assimilate a great mass of new facts set forth in text-books and periodicals. In such cases a handy book of clear-cut simple questions and answers is most useful in directing attention to the main points which it is essential to understand, and Mr. Risdon has been successful in putting together just what is required.

An unusual, and commendable, feature of the book is the inclusion of a number of incorrect diagrams with explanations of why they are wrong, a scheme which should certainly help the beginner who is apt to accept even simple circuits without fully understanding the use of the various devices shown.

The answers given throughout are concise and clear, and with the possible exception of numbers 112, 215, 219, and 224, are sufficiently accurate for the needs of the beginner. No. 199, too, omits to state the units employed; but this rather meticulous criticism is hardly apposite in dealing with an elementary book, which, as we have indicated, fulfils well the purpose for which it was written.

A satisfactory index is included.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A "Fuse-Blown" Indicator.

With a view to saving time in locating "blown" fuses in large installations, the BRIGHTON LIGHTING & ELECTRICAL ENGINEERING CO., LTD., is placing on the market a switch-fuse combination, the "Telltale," fig. 1, in which is incorporated an indicating device for denoting when the fuse has blown.

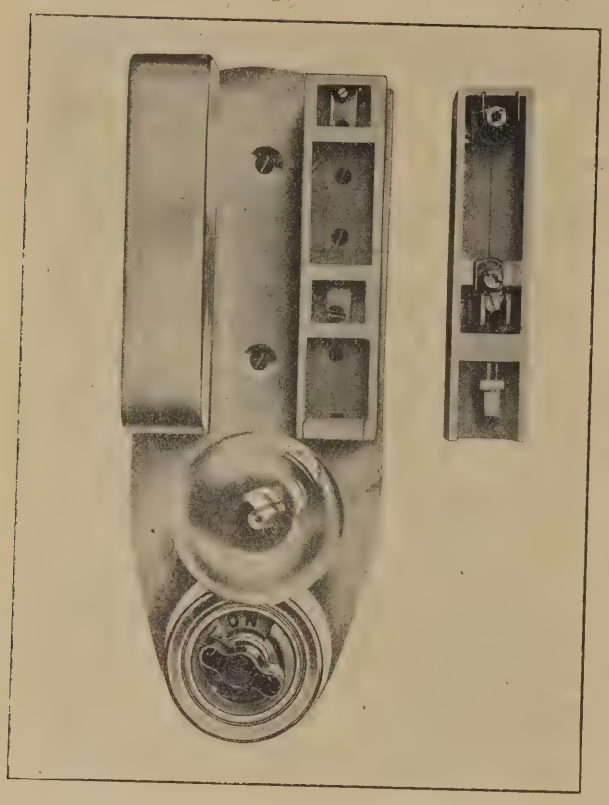

Fig. 1.—Switch-Fuse Unit with Indicator.

This consists of a small switch which is held open when the fuse is intact, and a small lamp. The latter is put in circuit when the fuse is broken by the small switch, which falls on to contacts and closes the lamp circuit. The unit can be supplied with any number of ways and is provided with 10 spare fuses.

A Novel Generating Set.

The accompanying illustration, fig. 2, is of a 42-kW generating set recently supplied by MESSRS. J. W. BROOKE & CO., LTD., Adrian Works, Lowestoft, for shipment abroad. It is of particular interest in that the engine is an example of the marine type of motors which are being built by this firm and adopted for industrial purposes. The motor is a "Brooke" 65-h.p., six-cylinder, heavy-duty unit, having a bore of 5½ in. and a stroke of 6 in., the pistons, connecting rods, bearings, valve guides and many other accessory parts being renewable and interchangeable. All parts are claimed to be accurately constructed of the best material, the cylinders and pistons being of hard, close-grained cast-iron, the camshaft of low-carbon steel and the crankshaft and valves of nickel-steel.

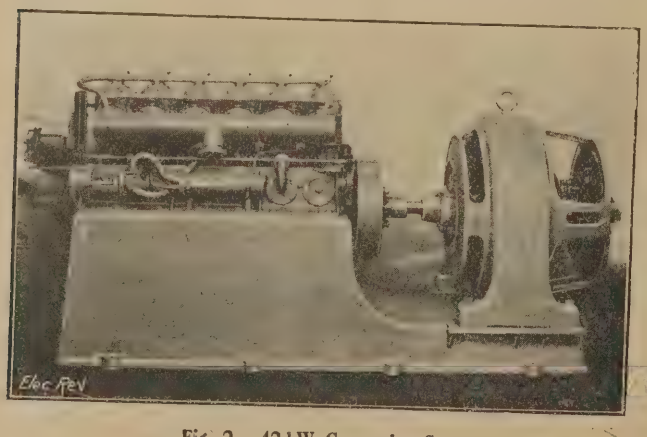

Fig. 2.—42-kW Generating Set.

Accurate grinding is a feature of the cams, crankshafts, pistons, &c. The engine runs at 1,000 r.p.m.

We understand that this type of unit follows closely the design of the first model produced, differing only in features which govern accessibility, silence and increased efficiency. The generator is a d.c. "Crompton" D.B. 60 model, directly coupled to the motor and having an output of 42 kW at 470 V, 1,000 r.p.m. It is compound wound, of the standard open bracket type, and conforms, it is claimed, with the requirements of the latest B.E.S.A. specification. The combination is mounted upon a cast-iron bedplate giving it adequate rigidity, and is an example of the British produced plant for which oversea demand is increasing.

"Mazda" Decorative Lamps.

THE BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, W.C.2, has produced a convenient and safe means of decoration by small "Mazda" lamps. This consists of a plug adaptor from which issue eight or sixteen pairs of leads. To each pair a 14-V, 7-W "Mazda" lamp in an M.E.S. lamp-holder is attached. The lamps can be supplied in a variety of colours. The eight- and sixteen-pair sets are for use on 100/130-V and 200/260-V circuits respectively.

A Novel Electric Clock.

An electric turret clock with a detachable centre, fig. 3, is a recent production of the SYNCHRONOME CO., LTD., 19, Caxton House, Westminster, London, S.W.1. This construction is rendered possible by the installation of a one-wheel electrical impulse movement behind the centre of the dial, which is controlled from the master clock. The outer ring of the face

Fig. 3.—Electric Clock with Detachable Dial.

carries the hour figures and minute marks and is permanently attached to the building in the ordinary manner, while the centre panel is a separate construction buttoned into position; it can be hinged or altogether detached and drawn inwards, thereby providing access for attention to the movement, hands and clock face.

A New Pattern Flame-Proof Switch.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2, has made an interesting addition to its range of flame-proof switchgear by the production of the 10-ampere combination, illustrated in figs. 4 and 5, which embodies the "D.B. Junior" d.p. switch movement and Home Office pattern cut-out interiors, mounted in a heavy cast-iron case

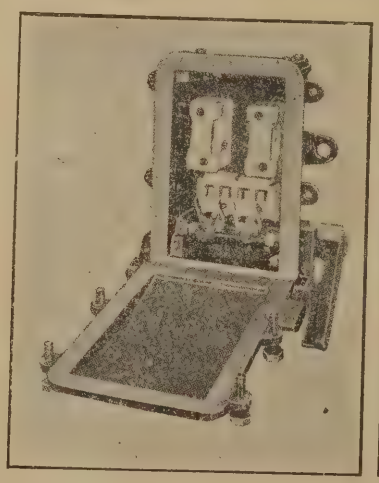

Fig. 4.—Flame-Proof Switch, open.

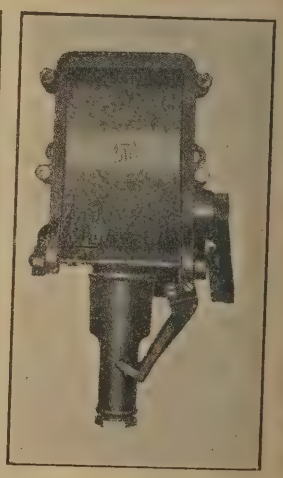

Fig. 5.—Flame-Proof Switch showing interlocked plug.

with wide machined flanges. It is provided with detachable top and bottom plates to accommodate standard flame-proof glands, and flame-proof cable-dividing boxes can also be fitted in place of these when required. It is of robust construction, and is specially designed for service in mines and other situations where explosive or inflammable gases are present. It is equipped with an interlocked plug combination suitable for connecting to portable apparatus.

The Need for Profitable Production.

The Financial Problems of Industrial Undertakings.

By J. S. HIGHFIELD, A.K.C., M.Inst.C.E., M.I.E.E.

(*Abstract of Presidential Address*: JUNIOR INSTITUTION OF ENGINEERS.)

THE times are difficult! How many of us have had to direct or manage a business which has fallen on evil times? Our talk, no matter what the starting point, drifts round to the general state of trade and the future of the Empire.

The problem can be solved only by steady, patient, unselfish work on the part of every individual who has the chance to help by providing useful work, if only for one man who lacks a job. Government cannot solve such a problem except by removing, when possible, restrictions which stand in the way of the citizens who elected it. One of the best ways for the ordinary man to help is by buying home-made goods.

The success of the country as a whole depends on the cumulative success of those who are engaged in producing food, clothing, housing, or the means of attaining these necessities, and so long as the average flourish, all is well with the State. Consequently, the difficulties which beset an individual producer in some small measure parallel the difficulties of the State of which that producer forms a tiny part. Considering the re-establishment of a business which has approached the state of bankruptcy, the first condition to be faced by those managing the business is that no one else will lend them money; their credit has gone; and since those who managed the business brought it to the state where the incoming revenue was less than the outgoing payments until its money and credit were exhausted, it is usually necessary to call in an outsider to try and put matters right. A manufacturing business selling its products all over the world consists of some hundreds of shareholders, which has borrowed as much capital as it was able to do in the form of debentures secured on the property. Assume that its sales are just sufficient to meet all charges for raw material, rent, rates, and management, with nothing for directors' fees or for interest on its borrowed capital, and that its sales are falling. Anyone called in to put matters straight must first find money enough to carry on. If neither the shareholders will subscribe for additional shares, nor the debenture holders lend more money to protect the sums they have already lent, he must apply to outside persons. These will certainly refuse to lend money unless they can have the right to the first proceeds of a sale of the plant in the event of the venture failing, and their terms will be onerous in proportion to the risk.

In these circumstances the factory and plant have ceased to provide any free money, they call for money to keep them going; the asset has become a liability. Assume that there exist contracts, or promises of contracts, sufficiently hopeful to persuade the debenture holders to advance further money as a first charge, conditionally on the shareholders giving up, say, four-fifths of their holding and that (until the sum borrowed be repaid) they are to receive 1 per cent. extra interest on their debentures; thus putting pressure on the management to repay the loan as soon as possible.

Having obtained working capital, the next move is to reduce costs so that the money may last as long as possible. Out of several processes one or more may have lost money for years; these must be closed down and men and staff paid off. Every source of waste must be stopped, and salaries may be reduced, or expensive men paid off to make way for less expensive ones; idle men must mend their ways, or go. This process involves hardships to individuals; it is sad and distressing, but it must be carried out, or the whole enterprise be abandoned.

On the revenue side strenuous efforts are made to complete outstanding work as speedily as possible in order to obtain payment quickly and to reduce cost. New orders must be obtained, even at low prices, but not at losing prices. Only when the business succeeds can it afford to face, for a time, losing prices.

This brings me to the human side of the difficulty. During the time that has elapsed since the dangerous position was faced, the new man and the directors have been working all hours, negotiating with difficult shareholders and debenture-holders, with bankers and others who might help; discussing difficulties with busy men whom they could only meet out of hours; anxious and difficult discussion with many overworked and harassed men. Such is the position of many men at the head of affairs, especially in these difficult times. Meanwhile, men on the staff have wondered how long their jobs would last, the best have wondered what they could do to help, filled with vague feelings of anxiety. A friend of the firm writes from Central Africa that if it can reduce the price of some article from, say, 1s. to 9d., he can sell many thousands to natives. Word comes from a large town at home that an order worth many thousand pounds can be gained at a certain price. These orders, if obtained, would ensure work for twelve months for all hands and more. The new man and his staff examine eagerly all possible means of bringing the estimate of cost to the needful figure, and, when all is weighed up, find that only if a greater output per £1 of wages is obtained can they make ends meet. They should then be free to explain the case to their men with confidence that they would be listened to and supported. I have known cases where this has been done and an order obtained. It should always be possible. Consider the situation: To obtain these orders means plenty of work for all, either at the same wages and hours if greater output be given, or at the same wages and more hours if the individual output is already at a maximum. The extra effort either way means that the business and the steady employment it has provided for years may, by the joint effort of all, not only continue, but increase. Without the extra output everyone will be out of a job.

I assume that the designers, before the men are approached, have done all they know to improve details of design and shop methods to save money in every way; that is the designer's job; also that those responsible for arranging the supply of raw material, the methods of packing, and the freight rates, equally have done their best. Further, that the men agree to satisfactory terms, and the orders are obtained. It is then that orders for raw material are placed and the works start to manufacture; wages have to be paid week by week, and the borrowed money drawn on to pay for raw material, wages, rent, rates, and all other charges. In due time the goods are shipped and payment is received. The margin of profit is narrow, and you can imagine the close watch that must be kept on expenditure to make sure that the work will be done so that at the end of the contract the money received exceeds the outgoings. Any delay in the shops, any delay in the delivery of raw material, any bad workmanship will add to the cost and so put the venture in jeopardy.

But this is only the first step for the new man; he has, I assume, secured work only for one year. The obtaining of new orders depends on the promptness and skill with which his first work is executed, and if the works have in the past borne a good name he is greatly helped. That is goodwill won by past honest efforts and has itself a market value; it is a source of credit. I assume all goes well, and that at the end of the year not only has the original sum borrowed not diminished, but that a considerable sum has been added to it. I assume that new orders have been obtained, that methods of reducing cost have been evolved, that the output per man has exceeded expectations, and thus that the same goods can be offered at a lower price, but with a better margin of profit.

If this margin continue year by year cash will accumulate. Interest on the old and new debt will be paid, but no dividends; all excess money will be conserved until the day arrives when the new money borrowed to keep the works running can be repaid. This step will at once lead to reduced cost. First, if further money be required, it can be borrowed at less interest than the onerous terms necessarily charged when the risk is great, and the added 1 per cent. is saved on the interest on the original debentures. If no further cash is required the whole interest is saved, and the annual amount added year by year to the cash resources. This money is used to buy new machinery to replace old, to provide new shops, which again produce added profits, so that another red letter day arrives when the cash surplus is so large that dividends on the share capital may be resumed.

A condition made by the lenders of the money that enabled the works to be restarted was that the ordinary shares were to be written down from £5 to £1 each. Prosperity is not restored to the shareholders until their shares can be put back to the original value by skill and hard work and saving, by keeping in hand more money than goes out.

The undistributed profits are added to the reserve fund, and on a later and still more glorious day these undistributed profits, really the savings of the shareholders, enable their losses to be restored, but after many days.

The next stage is that, with increasing dividends, the value of the shares increases until the time comes when, if more money is wanted, the shareholders will advance it, even to the extent of paying 30s. for a £1 share. At this stage the business is usually called a rich company. What does rich mean?

I assume the capital of my business to be in the form of ordinary shares and that it has borrowed £20,000, and that at the time when it may be described as rich the contents of its accounts are as shown in Table I on the following page.

Now observe that the real protection to the business is the amounts put aside to reserve and depreciation; in the above case they represent 15 per cent. of the gross income and one-half of the wages bill. This sum can be used to purchase new plant at least in part, for experimental purposes, or for any venture which may, if successful, lead to increased profit. There is no hard and fast rule by which to calculate the proper amount to place to reserve or depreciation. The calculations as to the life of the plant—to use accounts' jargon, "the physical life of the assets"—are useless, because invention by yourself, or, worse still, by your competitor, may at any time make much of your plant obsolete; that is to say, you cannot afford to run it. Only experience and complete knowledge of

every likely turn in your trade are of use, and prudent care is the best guide for settling the amount that should be put to reserve.

Table I.

Share Capital			£100,000
Debentures			20,000
Cash			5,000
Reserve			20,000
Gross receipts			£100,000
Costs :—			
(a) *Not wholly under control* :—			
Raw material	£25,000		
Rates and taxes	2,000		
Freight	2,000		
Power	2,000		
		31,000	
(b) *Under control* :—			
Wages	30,000		
Management and general charges	13,000	43,000	74,000
Surplus			£26,000
Application of Surplus :			
Interest		£1,000	
Depreciation		5,000	
Reserve		10,000	
Dividend on ordinary shares ...		8,000	
Carried forward		2,000	

So far we have been considering and admiring the forethought and skill of the new management, the accuracy of the designers, and the whole-hearted ability and industry of foremen and men, but of the total income of £100,000, £31,000 has been paid to outside people, £25,000 for raw material, £2,000 to rates and taxes, £2,000 to the railways and shippers for freight, £2,000 for power. These sums, more than the dividend and reserve, are all paid to outside servants of the producers. Are they giving full value for the money paid them? If they fail to work "all out," they are a drag on our business. At the present time these people receive too much for their services—wages more than the producers receive. The producers find the money to pay them; therefore the producers should see to it that they call the tune. Wages account for £30,000, and the shareholders have £8,000. The new manager sees his reserve ample; he is paying 8 per cent. to his ordinary shareholders, and profits grow. What should be done with the added profits? Prices, I assume, have already been reduced, and his own pay and that of his staff have already been increased. Foremen and men should also share; probably the former have already received bonuses, but the men should share also, and here sometimes comes the difficulty owing to the system of collective bargaining, which tends to make the wage rate equal for equal work, no matter if the business be failing or prosperous. This is a most unnatural arrangement. It prevents a man ever enjoying good fortune; he may also suffer bad luck, which comes to all, even if it were possible to secure to all a regular income. Therefore, surely to deny to man the enjoyment of good fortune is to take away from him the chief incentment to effort! No, when the works prosper, the men who have helped to its prosperity should be rewarded with a share of the surplus, but if they enjoy a surplus, another time of danger is reached. What will they all do with it—the new managers, his staff, his men, and the shareholders? The answer is clear. The surplus they enjoy is due, apart from hard work and skill, to prudent use of profit when it was gained. Therefore, let every man enjoying a surplus preserve it in the same prudent way, invest it in something that is productive. Thus each man in the works becomes a capitalist. The elements of success are determination, courage, daring, steady application, skill, faith, and thrift. Very few men possess all these qualities and characteristics, and far fewer still have the capacity to impart them to others. If you find a true experienced leader, follow him.

The few figures I give show how small is the margin which separates the successful from the unsuccessful business. In the early stages of the business I describe the slightest accident would have resulted in the works being no longer a source of livelihood to many men, a source of prosperity to its environment with rate collectors, road menders, railwaymen, sailors, and government officials receiving payment from its production. Faulty designs, a strike of its own men, or a slowing up of their work, would have made those first contracts unprofitable; a stoppage in the works supplying raw material, a stoppage involving delay in railways or shipping would have prevented the contracts being completed in due time, and would have added to costs. Any of these causes would have brought the venture to ruin. Thus does each man depend for his daily bread on the constant efforts of his fellows.

Who builds a works or a ship? Why, those who have enjoyed a surplus above what they require for their living expenses. And how is the works or ship built? First, with accommodation for the men who work them, and in a ship living accommodation is also provided. And the accommodation is provided and the works built in the belief that men with sufficient skill will work and use works or ship for various other men who will pay for the service rendered; in the faith that the men who work will do so in such wise that in due course the cost will be repaid with profit. Destroy this faith and ordered civilisation falls to the ground, and we go back to the days when each man grew just as much food as he needed and with such difficulty that when his precarious crop failed he robbed, if he were able, his neighbour.

Civilisation started when the average man in a working day began to grow more food than he required. He then fed the other man while he forged him a new plough, again increasing his output in the same time, and so leading to a greater surplus. All trade is built on the output of the farmer and the fisherman, and on trade rests the ordered life of civilisation. But to-day we suffer from a sad demoralisation of values caused by the war. Some of our old markets have gone; some of our old customers are bankrupt. In time, but only in time, by the methods of my new man will they restore their prosperity, and with their help ours: but only if we render them service at reasonable prices.

I think there is a growing understanding of the relative values of different classes of work. I believe there is a better knowledge of the absolute necessity of successful production of everything that may be grown, or won, or manufactured. Those engaged in these trades are the basis of all. The carriers, the railways and shipping and other forms of transport all depend on production. Electricity is one great means to this end. Consequently the welfare of the producer should be the care of all. It should be the first business of government to see that the man who ventures into the field of direct production has a fair chance to succeed. The man who seeks a large salary with a pension is a greater man than he who seeks a small salary and a pension; both, however, can enjoy their salary and pension only if the direct producer provides the wherewithal. I am not despising the salary earner. I only want him to remember that he is secondary to our producer, and that his job is to give loyal and skilful help to the man who provides the foundation on which his salary and pension rest.

Figures are a dull subject, but they reveal subjects of moving moment to every engineer. I have analysed the essential figures of various industries, taking the revenue to be 100, and worked out the other figures as percentages. The Table II subdivision is only approximate: for instance, the management can determine the quantity of raw material purchased depending on economical use, such as the quantity of coal used in a power station. Again, the rate of wages is but little under control, though the number of men employed is, but the broad division, despite some overlapping, is useful. Eight per cent. would generally represent 6 per cent. on the preference, and 10 per cent. on the ordinary, shares. The shareable profit is all that is available for profit-sharing schemes.

The figures of the electricity supply undertakings show that in all cases the costs in division A exceed those in B; that the total working expenses are about one-half the revenue, and that the capital expended on works is from three to five times the amount of revenue; in other words, the rate of turnover is small. Nos. 1, 2, 3, 4, mainly supply urban lighting; about one-half the revenue is derived from this source. Nos. 5 and 6 derive 90 per cent. of the revenue from power, that is why the percentage payment for coal is high.

From the coal figures it follows that more capital can be spent on means to economise in the cost of coal in 5 and 6 than in the others. Note that the wages are always less than 15 per cent. of the revenue, and that rates and taxes are a very important item of cost. The most important part of the cost, however, is the payment on capital in the third division, nearly one-half the total. For this reason the greatest care must be exercised in its expenditure, and in the equally important question of finding the money cheaply. The cheapest method is, first, to make ample provision for reserve, to use a large portion of profits to buy new plant; this will aid the next important matter, to provide for paying a sufficient dividend to attract the investor who will always invest his money where it is secure, and the best test of security is ample reserve and dividend.

Let us now study the figures for works and mines :—

No. 1 produces heavy machinery, and the ratio of capital to revenue is much less than for the electricity supply undertakings. The ratio of (*a*) to (*b*) costs is much higher and the balance of revenue over costs is negligible. In other words, there is no profit, and this unfortunately is the position of many heavy engineering works to-day.

No. 2 produces light apparatus in large demand; the capital is only 19 per cent. of the revenue and the surplus of revenue over costs is nearly 75 per cent. of the capital. The small capital and large turnover indicate that the plant is very fully employed, and a large sum is required to write off the value of the plant in a very few years, because it will be worn out quickly. The figures are typical of works producing cheap articles by mass production, articles in large and common demand. If the articles are made by a patented process prices can be for a time maintained. If not every year, it will be found that prices must be reduced owing to competition in various forms, and, consequently, very large sums must be put to reserve to provide for new machinery, either to reduce cost, or increase output, or both. The rate of dividend will generally be high in good years, but usually cannot be long maintained.

In both works, wages and salaries are nearly 35 per cent. of the total costs. The rate of turnover is an important figure that has a great effect on the cost of the product; if the ratio to capital is one, then, if each article carries a clear 10 per cent. profit, the profit on the whole capital is 10 per cent.; if the turnover can be increased to two, the profit per article can be reduced to 5 per cent. and still yield 10 per cent. on the capital. Consequently, a high rate of profit where the turnover is large usually exists side by side with the production of articles each carrying a very small rate of profit. In this case the costs are 86 per cent. of the revenue, leaving 14 per cent. surplus, and

since the turnover is about five, it follows that the surplus per article is less than 3 per cent. In these conditions the closest watch over costs is necessary to prevent the small rate of profit per article turning into a small loss, which would involve a large total loss.

Now turn to the figures for mines. Nos. 3 and 4 represent colliery figures for 1913 and 1924. I cannot say whether they are typical, but at any rate they are illuminating. Whereas in 1913 a capital of 39.8 produced a revenue of 100, in 1924, 56 was required to produce the same percentage revenue, showing a decline of turnover. Wages were 54 in 1913, and 70 in 1924. Management declined from 10.8 in 1913 to 7.3 in 1924. In 1913 the total costs were 90.8 per cent. of the gross revenue, the surplus of 9.2 per cent. being placed to reserve or carried to next year. In 1924 there was a deficit of 6.8 per cent. of the gross revenue. Since prices had already been increased, the result was clearly due to reduced output, and it is obvious that, if this condition continue, the colliery must soon shut down.

Note the varying profit-earning capacity of these few examples. There is no sure way of maintaining profit at constant value, although it is more easy to do so in one business than another; but no matter what care be taken at some time or another a business must face a loss, when it can only be kept going by the owners finding money to meet the losses. The profits, therefore, must belong to those who are able and willing to shoulder the losses. I include in this category shareholders who put up with reduced dividends without unreasonable grumbling—they are few; directors who forego fees and often assist the finance; also men on the staff or in the works who either put in more work for the same money, or take less money in order to keep the enterprise going. All are in their several ways shouldering the losses.

Finally, there are no shareable profits in some of my examples; in the best a reduction of only 5 per cent. in the selling price would wipe out this item. The amount can be increased, either by increasing the selling price, or reducing some item of cost, but in any event experience shows that this amount can be attained only with most excellent and wholehearted endeavour on the part of all who work the enterprise.

Apart from any payment depending on direct work, many men will save money. It is well if the men employed in any business invest at least a part of their savings in the buisness.

There is, I think fortunately, a growing tendency to facilitate such investment. I am not inclined to believe in creating any special form of security for the purpose; the employés should stand, in this respect, on an equal footing with other shareholders; however, facilities could be readily provided to make it easy for any employés to acquire either ordinary or preference shares, or to take a part in providing capital in the form of loans. The value of each class of capital should be made clear, and a scheme enabling shares to be acquired by weekly contributions would help. A limited liability company was for long regarded as a bad invention, and no doubt the change from private firms involved much hardship. There was the loss of a clear undertanding of the joint interest of all concerned in working the company. The master was not personally known to his men.

Modern production has, however, been built up on the company system and could not exist without it, and there has grown up a better knowledge of how to govern and work these great organisations. The constitution of a company is fully democratic, every shareholder has votes in proportion to the number of shares he holds. If everyone in the country, and especially men in their own works, held shares, then it would be to the common interest to care for the welfare of the business as an owner. It is for this reason that the wider holding of shares in producing works should be encouraged.

I have chosen a dry subject, but one which engineers should consider; it is one which all managing engineers must consider. It is important and the main elements are, or can be made, relatively simple; it is merely the difficulty of seeing the wood rather than individual trees. There are too few businesses involving engineering managed by engineers, but unless they learn the elements of money management, and above all the supreme necessity of managing them profitably, they are unqualified for the job.

I am sure that there are many engineers with the natural qualification for management who could usefully give their close attention to the study of business essentials.

I am directing your attention essentially to the problem of improving trade, to the duty of facing the present difficulties as our forefathers faced them in 1816. At that time engineers had a great hand in restoring prosperity. Their inventions were important, but equally important were the results on the minds of the men who in rapidly increasing numbers were drawn into the work of manufacturing and improving these inventions. The great fruitfulness of new ideas is in stimulating the minds of lesser men to think a little in terms of the unknown, and to forget the shibboleths of their normal work. Trained engineers will give the best service in inventing and scheming new designs and methods aimed at greater efficiency and less cost. There is any amount of work in these directions, and British brains are as good as any.

Manufacturers might help young men with ideas to develop their talent. A surprising number of firms manufacture plant under foreign patents for which they have paid large sums.

TABLE showing the proportions of the gross receipts required to meet the several items of costs, including capital for various manufacturing and other businesses. All the figures in this table, except the figure for gross receipts, are percentages of the gross receipts.

	Electricity Supply Undertakings.								Manufacturing Works.			Colliery.	
	Company.					Municipal.

Amount required to provide 8 per cent. dividend on share capital	21·2	13·8	17·1	14·4	20·2	—	—	—	10·2	1·5	9·0	3·2	4·5
Sharable profit	3·4	3·5	1·9	—	—	—	6·6	—	—	2·3	2·7	—	—

NOTE.—The method adopted in preparing this table is to take 100 to represent the gross receipts from all sources, the amount of capital and costs under their various headings being shown as percentages of these gross receipts. The costs are divided into three parts:—
(*a*) The sums paid to outside parties for raw material, freight, rates, &c., over which the management has little or no control;
(*b*) Costs, such as wages, management and overhead charges, over which more or less control can by exercised by the management;
(*c*) Capital costs, being interest on borrowed money, sinking funds, depreciation, and reserve; and amounts paid to shareholders in the way of dividends.

Many of these inventions have required great modification before they would work, sometimes until little of the original was left, and often far less sums spent on home-made designs would produce at least equal results in less time and with the great advantage of encouraging native talent.

One other requirement of paramount importance is leadership, and in pressing the importance of working for profitable production, I wish to make it quite clear that profit is only a means to an end. Profit is the simplest and surest means of measuring efficiency of production, always provided that the total sum of profit as well as the rate of profit is used as the unit of measurement. A high rate of profit on small production is usually attained only when some restriction of output, or use, can be set up. This method may be described as profiteering.

Production may relate to true luxuries, such as diamonds, or it may relate to articles which should be sufficiently cheap to be in common use, but which, for a time, are made luxuries by restricted output. Houses are necessities; motor cars were luxuries, but owing to restrictive action, on the one hand, and to the use of sound business principles, on the other, the position has been reversed. Small houses are almost a luxury, and small cars almost a necessity. Had the same skill and effort been applied to the construction of small houses as to the construction of small cars, the housing problem would have been solved, and the builders would have realised a large profit rather than a high rate of profit. Profit is a rough standard of measurement of efficiency in the conduct of business, and without efficiency no surplus can be gained.

I have dwelt on the importance of all concerned in industry working together for a surplus, not as an end in itself, but as a means to an end. Having gained the surplus, its proper use will enable us to progress in all the things really worth doing: refinements of artists, both in industry and in art, and in all the things really worth having; those enduring possessions necessary to good fellowship, which are the joy of life.

Electrical Development in New Zealand.

Opportunities for British Manufacturers.

By "HOMIE."

THE electrical development of New Zealand is proceeding at a rapid pace, and there are now eighty-seven Power Boards or distributing authorities supplying various areas in the country. The total population included in those areas of electric power supply is 930,980, or over 70 per cent. of the total population of the Dominion, so that the ideal of a supply being available to every home in the Dominion is well on the way to realisation. In the past year the number of consumers supplied has increased from 124,705 to 148,699, an increase of 19 per cent. Out of the eighty-seven distributing authorities, fifty-nine showed a profit for the year amounting to £162,376, and twenty-eight showed a loss amounting to £36,492. The general result was a net profit for the whole Dominion of £125,884, after paying working costs (£780,826) and capital charges (£732,086) at the rate of 7.6 per cent. on the total capital outlay of £9,566,589. This shows a net profit of 1.31 per cent., as compared with 1.85 per cent. last year. The business on the whole is thus a thoroughly sound and remunerative one, as well as supplying a public necessity to 70 per cent. of the population of the Dominion.

Mr. F. T. M. Kissell, the Chief Government Electrical Engineer, in his annual report, after stating that negotiations are taking place with the authorities concerned with the revision of the rules for wiring which will shortly be reissued, says that another matter somewhat allied with the regulations is the question of testing and approving all kinds of apparatus brought into the country for use by consumers. A certain amount of this inspection is being done by the local authorities and by the fire underwriters; but the electrical development in the past few years has been so great that it is extremely doubtful if this important matter has been receiving the attention that is necessary to maintain a high standard of installation throughout the country. Consideration is being given to the establishment of a central testing laboratory, and approval board, specially to deal with all types of appliances imported into the country, to carry out tests on plant and apparatus for local authorities, and at the same time to do a certain amount of experimental and research work on problems peculiar to electrical development in the country.

It will be seen from the above statement that all imported goods have to be of substantial construction and a high standard of efficiency; and manufacturers in Great Britain should make note of this when offering their goods for sale in this country.

There is great scope in the Dominion for British manufacturers, especially of domestic appliances, and it strikes one as being very strange that there are so few of them represented here. Most of the material for installation work is British made, but it is in the hands of a very few firms, and regarding domestic appliances, they are almost wholly of American manufacture. There is no duty on material, apparatus, or machinery used in electrical development, or for installation work, but all domestic appliances imported are liable to 20 per cent. duty for British goods and 30 per cent. for foreign goods. Taking into consideration the extra cost of freight from Great Britain, the British manufacturer ought to be able to export goods to New Zealand to compete with American products, as he has less duty to pay. Even if he did not want to take the risk of exporting goods, or the expense of opening a branch in the Dominion, if he would only advertise his wares and send catalogues and price lists, with shipping dimensions and prices f.o.b. to the wholesale factors and electrical contractors, I am sure he would be amply repaid for his trouble. The manufacture of goods in the Dominion is absolutely prohibited by the high cost of labour, and the British manufacturer's only rival is the American.

The writer is of the opinion that it would be a very good idea if British manufacturers would state the prices of the various parts of their appliances and the shipping dimensions, as a number of the firms in the Dominion would be keen on manufacturing some of the parts themselves that could be economically produced, importing the other parts from Britain and assembling the appliances. There are various parts of electrical appliances that could be imported duty free, such as stampings, enamelled ware, mica, resistance wire, &c. The number of duty-free parts is far too numerous to be detailed in this article, but the Dominion manufacturer could easily find out which parts it would be cheaper to produce and which it would be cheaper to import, and combine them for the finished article.

The following extract from the report by Mr. Kissell will show that there is an enormous field for domestic appliances throughout the whole Dominion:—

"Most of the newly-formed boards are building up their loads at a faster rate than was contemplated, and the loads will considerably exceed the amounts they have guaranteed. It is anticipated that there will be a considerable increase in the domestic loading, particularly in electric ranges and hot water heaters. Returns have been obtained of the electric ranges in service in the areas of the different electric supply authorities. The total number of ranges connected is 1,526, which means that 1.02 per cent. of the total number of consumers are enjoying the advantages of electric cooking. The total number of supply authorities is eighty-seven, and of these fifty-five, or 62.5 per cent., have electric ranges connected to their systems. One supply authority has no fewer than 475 ranges connected. The total number of consumers in this district is 22,491, which gives a figure slightly in excess of two ranges to every 100 consumers. Three other supply authorities, however, have figures corresponding to over five ranges to every 100 consumers. When it is realised that some of the largest percentages are being obtained in districts in which the power has only been available for a few months, it is evident that a large increase in demand can be looked for when the authorities embark on an active canvass for this type of load. It is also particularly gratifying to see that the advent of electric power is bringing conveniences to the rural districts which should greatly improve the conditions of living therein."

There are no statistics available for other types of domestic appliances, but there are very few appliances such as vacuum cleaners, kettles, washing machines, fans, &c.; and as for that most indispensable article, the electric iron, the writer is certain that not more than 30 to 40 per cent. of the consumers have one. As the weather is never very cold except in some parts of the South Island, the demand for radiators is not very great, apart from a call for some of the smaller portable types. All that remains, then, is for British manufacturers to get into touch with some of the electrical firms in the Dominion and commence a great advertising campaign which will create a demand for British-made electrical goods and appliances, and now is the time to do it while the industry is still in its infancy. The writer's advice is: Get into it now and oust the American article from the market before Americans get the complete monopoly of the industry.

Electro-metallurgy in Norway.—The report for 1924-5 of the Porsgrund Elektrometallurgiske A.S. states that sale conditions were better than in the previous year, and prices were also good when considered in Norwegian kronen. The reorganisation of working which was commenced two years ago had yielded very satisfactory results. The net profit for the year is returned at 200,056 kr., and it has been applied partly to wiping out former losses. The prospects are said not to be bright owing to the confused power situation and the appreciation of the krone.

Electricity Supply Standards in France.—The French Government has recently issued regulations setting forth the standards to be adopted in connection with electricity distribution in France. The order provides that the standard type of current shall be three-phase a.c. with a frequency of 50 cycles per second. The use of d.c. or single-phase 50-cycle a.c. may, however, be authorised for important transmission lines, for traction purposes, and in certain rural areas. The standard voltages are as follows:—For d.c., 115, 230, and 460 V; for single-phase a.c., 115 and 230 V; for three-phase a.c., 115-200, 230-400, 1,000, 3,200, 5,500, 10,000, 15,000, 22,000, 30,000, 45,000, 60,000, 75,000, 90,000, 110,000, 150,000, 220,000 and 300,000 V. It is further provided that the Minister of Public Works may, after consultation with the Government Comité d'Electricité, permit variations from any of the standards.

The Faraday Society.

Two papers of electrical interest were contributed to the November meeting.

An Electric Vacuum Furnace.

Prof. J. R. PARTINGTON and Mr. W. L. ANFILOGOFF described an improved form of furnace of the Ruff type which they have found highly satisfactory for studying reactions at temperatures approaching the volatilisation of carbon. The furnace consists essentially of a graphite hot-tube surrounded by a radiation case to prevent loss of heat and enclosed in an air-tight water-cooled cast bronze casing. The graphite tube is sufficiently thick at the ends to allow the passage of the maximum current without getting hot, and sufficiently thin in the middle to give the necessary resistance to the current to obtain the requisite temperature. The radiation case consists of two cylindrical concentric graphite tubes, held in position by two graphite plates and supported by four magnesite cubes. The reacting substances, if solids, are placed in a graphite crucible set in the hot-tube, the inside of which may either be maintained as a vacuum or as an atmosphere of an inert or reacting gas. The paper contains a full description of the method of making and setting up the furnace, with complete working drawings.

The Correlation of the Permanent Magnetism and Specific Resistance of Some Pure Iron-Carbon Alloys.

This was the subject of a paper presented only a few weeks before his death by the late Prof. E. D. CAMPBELL, of the University of Michigan. This author had long been carrying out systematic work on the correlation of chemical constitution and magnetic properties, based on the idea that the latter might be partly due to solutes in solid solution and partly to the solvent iron. To reduce the problem to its simplest form a pure series of iron-carbon alloys had to be made, in order to eliminate the influence of other elements. In the present paper are described the magnetic properties of a freshly hardened and a slightly tempered series of alloys as measured by means of a special magnetic balance. These values are compared with the specific resistance of the hardened bars and with similar magnetic properties and specific resistance of very pure electrolytic iron. The tests, in the case of the alloys, were made on round bars 6.3 mm. in diameter and 15 cm. long, the carbon content of which varied from 0.05 to 1.50 per cent. The heat treatment was such that the carbides were as completely as possible in solution.

The experimental results show that increase of specific resistance of the alloys is almost proportional to the carbide concentration. The magnetic resistance increases more slowly than the specific resistance up to the eutectoid concentration, but more rapidly in the hypereutectoid alloys. This would appear to indicate that in order to keep magnetic resistance low it is necessary to have structurally free ferrite. The internal magneto-motive potential, to the presence of which is due the maintenance of a permanent field of force, increases rapidly with increase of carbide concentration to a maximum at about 0.60 per cent., after which there is little further increase. The considerable difference between the magneto-motive potential required to demagnetise the system and the internal magneto-motive potential would seem to indicate that while a considerable amount of energy is required to magnetise or polarise the solvent iron, the internal magneto-motive potential of this iron is quite small compared with that due to dissolved carbides whose force-fields have been brought into serial alignment by magnetisation. The maintenance of a permanent field of force at each end of a bar magnet is due to the presence of an internal magnetic resistance in the system, and it would seem to necessitate a continuous supply of energy to the magnet equal to that lost by open force fields.

No other solutes in iron seem to possess a magneto-motive potential comparable with that of dissolved carbides, although both the magneto-motive potential and the magnetic resistance may be modified by the presence of elements other than iron which have a stronger affinity for carbon than has iron.

Legal.

Extension of a G.E.C. Electric Fan Patent.

MR. JUSTICE TOMLIN, in the Chancery Division on December 16th, heard the petition of the General Electric Co., Ltd., for the prolongation of a patent for improvements in electric ceiling fans, of which it was assignee from Mr. P. S. Given. The ground of the petition was that the company had been deprived of the benefit of exploiting the patent owing to the intervention of the war.

MR. MORITZ, K.C., for the petitioners, said the patent related to electric motors designed to drive fans in a perpendicular position, such as ceiling fans. In that position there was a difficulty about lubrication, and the patent provided for the fixing of an oil-tight reservoir below connecting with a similar reservoir in the bearing above, which obviated the difficulty. Until the war the fans were making rapid headway with the public.

His Lordship granted an extension of the patent for three years.

B.T.-H. Litigation.

MR. JUSTICE TOMLIN, in the Chancery Division on December 15th, had mentioned to him the motion by the British Thomson-Houston Co., Ltd., for interim injunctions restraining alleged infringements of its electric lamp patents by E. A. Siderman, of Grafton Street, Tottenham Court Road, R. H. Wood, and W. T. Smith, Ltd.

MR. TREVOR WATSON, for the plaintiffs, said that on December 4th they obtained the injunctions *ex parte*. Messrs. W. T. Smith, Ltd., had now put in an affidavit to say that they had sub-let the wharf at Redhill Street, Albany Street, N.W., and therefore he was not asking for the injunction to be continued against them, and there would be no order against them, except that the costs would be costs in the action. Mr. Lavington, for R. & H. Wood, had asked for time to answer the plaintiffs' evidence. It was therefore agreed that the motion should be adjourned until the first motion day next term, the injunction being continued in the meantime. As to Siderman, he was to have been present, but had not appeared, and Mr. Watson asked for the same order against him as against Wood.

His Lordship assented, and made the orders asked for.

Weber v. Birkett.

IN the King's Bench Division on December 17th this case came up for re-trial before Mr. Justice Horridge and a special jury. The plaintiff was Major W. V. Weber, a Southend borough councillor, who alleged that the defendant, Mr. R. Birkett, borough electrical engineer of Southend, had libelled and slandered him. In the original action the jury awarded the plaintiff damages, but as they were unable to apportion the sum as between the issues of libel and slander, the judge would not accept the verdict.

Mr. E. CHARLES, K.C., on December 17th, said that the words complained of had characterised Major Weber as a hypocrite, guilty of treachery and unable to be trusted.

SIR HENRY MADDOCKS, K.C., for the defendant, said that his client had expressed his sorrow for what he had done. Mr. Birkett also appeared and repeated his apology. The jury awarded Major Weber £300 damages in respect of the slander and £450 for the libel. His Lordship accordingly entered judgment for £750 and costs.

An Electrical Trades Union Dispute.

MR. JUSTICE TOMLIN, in the Chancery Division, on December 18th, had mentioned to him two motions, Dennis and Others *v.* Cox, Arnold and Others, which related to the affairs of the London (East) Branch of the Electrical Trades Union.

Mr. GALBRAITH, K.C., for plaintiffs, said that the motions were before his Lordship on December 11th (*vide* our last issue, p. 970), and stood over for arrangements to be made to pay urgent benefits to members of the branch and to settle the actions, if possible. It had not been possible to settle the actions, but the benefits would be paid to the persons entitled to them. By arrangement, and subject to his Lordship's sanction, there would be no order in the motion except that the costs would be costs in the action.

HIS LORDSHIP assented.

Correspondence.

Correspondents should forward their communications at the earliest possible moment. *No letter can be published unless we have the writer's name and address in our possession.*

Overhead Distribution.

In reply to my letter in your issue of December 11th, Mr. Redgment is at some pains to claim that the residents of Brundall, near Norwich, thoroughly appreciate the electric power supplied from his pole-line down the village street. I have no wish to deny this, and, in fact, mentioned it in my letter, though the misplacement of a comma in the printing made the meaning perhaps somewhat obscure. Speaking of the present residents I said :—

"Though there is no doubt of their appreciation of electricity, for similar prospective owners a system of distribution which would look ugly in the outskirts of Manchester can hardly be classed as an attraction."

I do not suppose the residents now notice the poles, while Mr. Redgment, looking on them with the indulgent eye of a father, may by this time regard them as quite beautiful and a good substitute for the mangled trees.

It is possible to get used to anything, and one sees as a rule least of one's ordinary surroundings. Few people, for example, can describe accurately the pictures on their own dining-room wall, and I can even imagine nursemaids and their charges, in their daily perambulations in Hyde Park, passing "Rima" without a shudder.

But an ugly thing is not less ugly because certain people do not consciously see it, and the sub-conscious effect on them is probably equally unsatisfactory.

For long-distance transmission across country an overhead line is, of course, often the only commercial possibility. But I would suggest that we should recognise that it is ugly, keep it well away from the road (say, two fields off), give preference

to inconspicuous runs, and possibly go in for a little judicious planting of trees, as in the case of a recent gas-works scheme.

For local distribution in a fairly well populated area the overhead system has less to justify it from the point of view of capital cost, and much against it from other considerations.

Now, curiously enough, in the case of Brundall, the 6-mile transmission from Norwich is all underground, and it is only the distribution for about a mile each way that is overhead.

In the original article it was said that if the underground system had been adopted the cost to Brundall would have been something like four times as much. In his letter Mr. Redgment makes the definite statement that the cost of electricity would have been over double. This means that the interest on the *difference* in capital expenditure between the two systems on, say, a couple of miles, would have been greater than the interest on the whole of the present system (including long underground transmission and sub-station) plus the generating costs of the energy used.

Of course, one does not want to extract data from a consultant without fee, but in view of the importance to other villages I think actual figures would be appreciated in support of these statements.

S. E. Glendenning.

Norwich, *December 19th*, 1925.

The Metering of Three-phase Power.

As a meter engineer, I consider Mr. Malcolm is to be congratulated upon his very excellent article which appeared recently in your columns.

It is an indisputable fact that the importance of accuracy in respect of the methods employed for metering supplies of energy does not in general receive the amount of attention it should do, neither is it as yet universally recognised that meter work has become a "science of its own" and calls for more than the average amount of skill and intelligence if reliable results are to be looked for, or if the meter department of a supply undertaking is to be run on efficient and satisfactory lines.

The writer has himself at various times conducted a number of investigations with a view to determining to what extent the suspected sources of error in high-pressure metering equipment actually exist, and where they are found to exist in any appreciable degree, their exact influence upon the overall efficiency of the combined apparatus. The following is a brief survey of the conclusions arrived at.

In the first place, the question of "interaction" between the elements of a polyphase induction meter cannot, as Mr. H. H. Jaques asserts, be treated as a negligible quantity. It is true that the errors arising from this cause do not as a rule in themselves constitute any serious complication; it is only when they are acting in combination with other errors (either in the meters themselves or their auxiliary transformers, or both) that they have to be taken into serious consideration as affecting the accuracy of the combined equipment.

It is the writer's experience that the more likely source from which errors in registration are liable to accrue is from badly designed or inadequately rated auxiliary transformers used with the meters, or where such transformers in addition to operating the meters proper are called upon to supply current to indicating and recording instruments, trip coils, &c., or other apparatus capable of setting up induction in the circuit. For this reason it seems desirable that each meter or set of meters should be given its own transformers, and the connecting of devices other than the meters to them be strictly avoided.

Meters should always be calibrated together with their transformers, and very definite observations should be made at different points of the curve with the whole apparatus connected as for actual service conditions. If subsequent tests are taken *at the same points* but *without* the transformers, not only is information obtained as to the characteristics of the transformers themselves, but the data so obtained provide a very useful means of effecting any future adjustments to the meters more or less accurately, without the necessity of removing the transformers with the meters, which procedure is often inconvenient and troublesome.

The introduction of "check" or standard meters upon consumers' premises for the purpose of ascertaining the accuracy of the existing meters has been known to influence the characteristics of the secondary circuits of transformers, especially where these have not been over liberally rated. This condition is somewhat aggravated by the fact that where meters have been designed to function as "standards" they are usually, in order to obtain a good and permanent torque, constructed without regard to "shunt" or "series" losses; and whilst such meters are undoubtedly admirably suited to checking "straight-through" meters, they possess obvious disadvantages when employed for testing "on site" meters of the transformer pattern.

Other sources of error have been traced to the use of long and small-diameter conductors in the secondaries of current transformers. The effect is to "overburden" the transformer by increasing the resistance in this circuit, which results in bringing about an excessive ratio error.

Yet another cause of trouble, often met with, is the deterioration of the dielectric of these conductors, due often to leaking or spilled transformer or switch oil attacking it and creating the possibility of a portion of the current to be measured finding its way back to the transformers by paths other than through the meter. The same remarks apply of course if the meter itself has a low insulation resistance between its current-carrying parts and the metal case (provided this is earthed, as it should be). Slight or intermittent leakages of this description may go undetected for considerable periods.

The writer has in mind a typical case of this sort where for some apparently unexplainable reason there was always a large discrepancy between the readings of a pair of meters working together in series off a set of common current transformers having one pole of their secondaries connected to earth. Laboratory tests on the meters themselves having failed to reveal the cause, it was felt that there existed very strong grounds for serious investigation. It was subsequently discovered that owing to the vibration set up by a certain piece of machinery, one of the incoming leads to one of the meters periodically "earthed" to a piece of protruding metal. Previous tests applied to the wiring with a Megger over a week-end (when the machinery was idle) of course failed to reveal this, and the incident is quoted merely to show how, if only the one meter had been installed, the matter may have escaped detection indefinitely. The writer strongly advocates the use of tough rubber-sheathed cables of not less than 7/.036 for all such connections, making these as short as possible and using lugs to ensure good contact at the points of connection.

Tests have also been carried out with a view to determining the effects of changing wave form upon induction type meters, and while the writer has owing to lack of the necessary facilities been so far unable to deduce exactly to what degree the wave has been distorted from the true sine curve, he has succeeded by artificial means in bringing about a variety of conditions and changes.

The conclusion arrived at in respect of these tests is to the effect that the behaviour of the meter approximates very closely to that observed when testing for the effects of varying frequency, and it would be interesting if any of your readers could supply us with data of any similar tests they may have made under ideal conditions with the object of confirming this. In my opinion the question of price should always receive secondary consideration where energy is to be metered in any quantity, and more advantage should be taken of the capabilities of those engineers who specialise in this particular branch of the industry when schemes for metering such supplies are being mooted or carried into effect.

Meter Engineer.

December 14th, 1925.

All-Electric Houses.

With reference to Dr. S. Parker Smith's interesting paper on the "All Electric House" and the cost to run it, perhaps my experience over the past twelve years will help to popularise the use of electricity in the ordinary home.

I am connected to the Woolwich B.C.'s mains under a 4-year contract dated 1913 in the district of Eltham, Kent, and it is open to any householder to take up the same arrangement.

The terms are as follows:—£1 5s. less 20 per cent. per quarter for 434 units based on the wattage lamps connected when the house was wired. Any units over this amount per quarter, no matter for what purpose, whether heating, cooking, or lighting, are charged at 1d., less 20 per cent. The contract is also obtainable for 1, 2, 3, or 4 years at 5, 10, 15, or 20 per cent. respectively.

I use electricity for everything, with the exception of one coal fire in a large drawing room lit only in mid-winter, and a gas califont for hot water throughout the house.

The conservatory is warmed electrically by means of immersion heaters screwed into the bottom plugs of ordinary radiators. The bells are worked through a transformer off the mains and the number on the street door is done in Neon tube. The house is 7-roomed, with bath, &c.

The energy consumed and cost for the last three years are as follows:—1922, 8,532 u., £34 7s. 5d.; 1923, 9,797, £39 5s. 1d.; 1924, 6,661, £28 15s. 11d. There are two meters, but the readings are simply added.

I have induced several neighbours to adopt the contract, but they do not get the full benefit because they do not go far enough in the use of electricity. Several rooms have never been re-decorated since I entered the house.

I am often asked who supplies our meat; my answer is as follows: Take on electric cooking and never mind who the butcher is. Or, again, how do you manage to get such perfect toast, and the bacon done to a turn without being dried up?

I have found it very difficult to get householders to give consideration to the heating circuits in every room, and they dread the expense of the cooking apparatus and the handing-over to servants of the full care and charge of the various electrical apparatus in the kitchen.

They are full of admiration for the cleanliness and ease obtainable by using electrical appliances in the house. The final remark made to the wife is usually to the effect that "you see your husband is in the line."

B. J. Palmer.

London, *December 16th*, 1925.

The Risk of Lightning.—A survey made by Dr. A. W. Gilbert, Massachusetts Commissioner of Agriculture, shows that the chance of death by lightning in that State is only one in more than a million per annum. A man on the farm is 10½ times as likely to be struck by lightning as his city brother, due to the scarcity in rural communities of steel-framed buildings, trolley wires, &c.

National Health, Pensions and Unemployment Insurance.

By JOS. J. H. STANSFIELD.

THE Ministers of Health and Labour call attention to the changes in the rates of contributions for National Health and Pensions Insurance, and for Unemployment Insurance which come into effect from January 4th, 1926.

All persons insurable under the National Insurance Act are also insurable under the Widows', Orphans', and Old Age Contributory Pensions Act, 1925, and the contributions payable under both Acts will be paid on the same card by means of combined health and pensions stamps, cards being, as heretofore, issued to insured persons by their approved societies or obtainable from any Post Office. Employers must stamp the workers' cards for weeks of employment from January 4th, 1926, which date is the commencement of the first half-yearly period of 1926. Combined health and pensions insurance stamps of the values required will be purchaseable at any Post Office. As stocks of National Health and Unemployment Insurance stamps of the old denominations will be withdrawn from Post Offices after January 4th, it is essential that immediate steps should be taken to ensure that Health Insurance cards and Unemployment books are stamped up-to-date at the proper time.

In consequence of the new Act there have been substantial alterations in the weekly rates of contribution, and it may be of convenience to set out in detail the old and new rates.

RATES PAYABLE PRIOR TO JANUARY 4TH, 1926.

Health Insurance.—

	Total rate.	Employer's share.	Worker's share.
	d.	d.	d.
Men	10	5	5
Women	9	5	4
Exempt persons ...	5	5	—

If a worker aged 18 or upwards is not in receipt of board and lodging from the employer and the rate of remuneration does not exceed 4s. a working day the amount to be recovered will be less, as follows:—

(*a*) Where the wage is not over 3s. per day—

	d.	d.	d.
Men	10	10	—
Women	9	9	—

(*b*) Where the wage is over 3s. but not over 4s. per day—

	d.	d.	d.
Men	10	6	4
Women	9	6	3

Unemployment Insurance.—

	Total rate.	Employer's share.	Worker's share.
	s. d.	d.	d.
Men	1 7	10	9
Women	1 3	8	7
Boys, 16-18 ...	9½	5	4½
Girls ,, ...	8½	4½	4

In the case of exempt persons the employer is liable to pay the employer's share only.

RATES PAYABLE FROM JANUARY 4TH, 1926.

Health and Pensions.—

	Total rate.	Employer's share.	Worker's share.
	s. d.	d.	d.
Men	1 6	9	9
Women	1 1	7	6
Exempt persons—			
Men	11½	9	2½
Women	7	7	—

It will be noted that the new Act establishes the principle of a deduction in the case of exempt persons who are males.

A worker aged 18 and upwards under the circumstances before-mentioned pays a smaller contribution as follows:—

(*a*) Where the wage is not over 3s. per day—

	Total rate.	Employer's share.	Worker's share.
	s. d.	s. d.	d.
Men	1 6	1 1½	4½
Women	1 1	11	2

(*b*) Where the wage is over 3s., but not over 4s. per day:—

	s. d.	d.	d.
Men	1 6	10	8
Women	1 1	8	5

Unemployment—

	Total rate.	Employer's share.	Worker's share.
	s. d.	d.	d.
Men	1 3	8	7
Women	1 1	7	6
Boys, 16-18	7½	4	3½
Girls ,, ...	6½	3½	3

As before, in the case of exempt persons the employer will pay the employer's share only.

It will be seen that whilst there is a reduction in the rates for unemployment, there is an increase if health, pensions and unemployment are taken together.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

The Horley Special Order.—Much discussion has recently taken place in the House of Lords on the Horley and District Electricity Special Order, 1925. On December 8th Lord Peel moved that the Order be approved, but Lord Clarendon moved an amendment to the effect that, "having regard to the decision of a Select Committee of this House upon the Horley District Gas Company (Electricity Supply) Bill, the Special Order be not approved." He explained that the Order was promoted by a small electricity company in the district of Horley, whereas the Gas Company's Bill would provide for a materially larger area. Other advantages of the Bill were that capital would be much more easily and more cheaply raised, dividends would be limited, and thus cheaper electricity could be generated. Further, the Gas Company would begin the electricity business with an established *clientèle*. The authorised capital of the electricity company was only £20,000, and the consulting engineer had guaranteed of this amount a total of £5,000 on the understanding that he was to secure a management agreement for seven years. The House of Commons Committee rejected the Gas Company's Bill, which had been passed by the Lords, but the company was again concentrating on that Bill. If the Order were rejected, he could promise the House that the Gas Company would promote a measure on the same lines next Session.

LORD GAINFORD urged the House to agree to the Order and not to deprive Horley of electricity. The Barking 800,000 h.p. station with its production up to 100,000 kW, had got adequate mains within four miles of the Horley area of supply. The Order would enable the Horley Electricity Company to become distributors. The district would then get electricity as cheaply as it could possibly be generated in this country.

In the course of further debate, LORD DONOUGHMORE, Chairman of Committees, suggested that the Order, and the new Bill, when introduced, should be referred to a Joint Committee of both Houses in the early spring.

Later, LORD SALISBURY, on behalf of the Government, suggested that the debate should be adjourned for a week in order that further consideration might be given to the matter. This was agreed to, and, on the resumption of the debate on December 15th, Lord Salisbury moved that the debate be further adjourned until the Special Orders Committee had reported whether any further Parliamentary inquiry was desirable before the House proceeded to a decision on the amendment, and, if so, what form that inquiry should take.

The motion was then agreed to, and the debate adjourned.

Electrification of Indian Barracks.—On December 14th, EARL WINTERTON informed Mr. Attlee that the question of the improvement of the barrack accommodation and amenities in India was one that had been engaging the close attention of the Secretary for India. As regarded electrification a large programme had been approved under which all barracks for British troops would eventually be electrified, and progress had been made annually. The Government of India was now considering what steps could be taken to accelerate the completion of that programme. According to the latest information received from the Government of India the barracks at Cawnpore had already been completely electrified.

Capitalisation of Industry.—On December 14th, Mr. ATTLEE asked the Prime Minister, whether, in view of the recent example of over capitalisation in the engineering industry, he would consider appointing a Royal Commission to inquire into the whole subject of the capitalisation of industry.

Mr. BALDWIN said that that was one of the subjects which was being considered by the Committee on Industry and Trade and he did not think the appointment of another body would serve any useful purpose.

Wireless in Ships.—On December 15th, in reply to Mr. W. Baker, SIR P. CUNLIFFE-LISTER said that the sailing of each boat without wireless operators was considered separately, and where compliance with the law was rendered impossible by operators declining to sail owing to a strike, and by this alone,

the ship was not detained. It would be impracticable to distinguish between different classes of ships and different classes of cargo.

Electrical Development.—On December 15th, Captain BOURNE asked the Minister of Transport if the report of the special commission appointed to inquire into and report upon the future development and control of electricity had yet been presented; if so, was he in a position to make any statement on the subject; and could he say whether it was proposed to publish the report.

Colonel ASHLEY said that he was not in a position to add anything to the previous statements which had been made to the effect that the report had been received and was under consideration.

Government Electricity Proposals.—On December 16th, Mr. R. MORRISON asked the Prime Minister if he was in a position to state whether the Government had come to a decision with reference to its electricity proposals.

Mr. BALDWIN said he was not yet in a position to make a statement on this subject.

Mr. SNOWDEN asked the Prime Minister whether he was aware that it was more than six months since he said that this important matter was receiving the attention of the Government, and that shortly after that the Minister of Transport said that the report of the committee of experts had been received and was receiving the attention of the Special Committee.

Mr. BALDWIN said all that was quite true, and he hoped to have a Bill ready for next Session, but the preparation of such a Bill and the examination of the points which would be raised required many months' work.

Electricity Orders.—In the House of Lords on December 16th, the Barnsley Corporation Electricity Extension Special Order, 1925; the Preston Corporation Electricity Extension Special Order, 1925; and the Blackburn, Burnley, and Clitheroe Rural Districts Electricity Special Order were approved.

Adjournment.—The House of Commons adjourned on Tuesday last, and will re-assemble early in February.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from December 16th. In the case of foreign applications, the names and addresses of the British representatives are also given.

Batwin (lettering and design). No. 463,708. Class 6. Electrical machinery.—Power Contracts, Ltd., 138-140, Southwark Street, S.E.1.

Ellipso. No. 460,597. Class 6. Electric fans.—Giljay Patents, Ltd., King's Road, Hay Mills, Birmingham.

Nuk (lettering and design). No. 449,325. Class 8. Radio-telephonic apparatus.—Neufeldt & Kuhnke, Kiel, Germany. (J. L. Hydleman & Co., 32, Queen Victoria Street, E.C.4.)

Ella-Varic. No. 461,076. Class 8. Radio-telegraphic apparatus.—George Kent, Ltd., 199-201, High Holborn, W.C.1.

Kathoxyd (lettering and design). No. 461,686. Class 8. Detectors for use in radio-telephony.—O. M. Seemann, 133, Wilhelmstrasse, Berlin. (Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Thothmic. No. 462,320. Class 8. Automatic telephones, telegraphic apparatus, &c.—A. H. Development Syndicate, Ltd., Iliffe Street, Walworth, S.E.17.

Nillos, No. 463,700, and Nonmic, No. 464,063. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Igranic Electric Co., Ltd.

Sferavox. No. 462,973 and 462,974. All goods in Classes 8 and 9, and Sferophone, No. 462,976. All goods in Class 9.—Société Française Radio-Electrique, 79, Boulevard Haussmann, Paris. (Marks & Clark, 57-58, Lincoln's Inn Fields, W.C.2.)

Compactum. No. 463,900. Class 8. Instruments, apparatus and parts thereof for use in radio-telephony and telegraphy.—Edison Swan Electric Co., Ltd.

Trickle. No. 463,994. Class 4. Electrolytic rectifiers.—Radio Accessories, Ltd.

Employment and Wages.—Col. F. V. Willey, C.M.G., president of the Federation of British Industries, recently delivered an address to the Glasgow branch of the Federation. In the course of this he referred to the fluctuations of the trade cycle—"booms" followed by periods of depression—and said that some attempt at scientific modification was necessary. There was a belief that larger units in industry should be considered as a means of decreasing working costs, instead of the lowering of wages. The rise in the value of the currency should have raised the real value of wages, but many factors, like the disproportion between sheltered and unsheltered trades, the result of internal distribution on social services, had retarded or prevented the normal economic process. It was therefore the more necessary to scrutinise other possible objects of attack before being finally forced to the course of wage reductions. The elimination of waste, the installation of more efficient machinery, and standardisation, would contribute largely to a saving in the national turnover. Col. Willey thought that payment by results, bonuses, &c., would stimulate the interest of the worker in his employment and would lead to a larger production. Higher earnings could often accompany a lower unit cost. Mentioning the growth of the deferred payment system in the United States, the speaker considered that it contributed towards an increase of commercial turnover and accelerated the improvement of the standard of living. Col. Willey also touched upon emigration, and said that there was a need for a bold Empire-settlement scheme which would develop the Empire and increase our trade.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

29,089. "Amplifying units for use in wireless systems." G. A. Mitchell. December 4th, 1924. (243,530.)

29,524. "Electrolyte for accumulators." V. L. Williams and L. L. Williams. December 9th, 1924. (243,537.)

29,545. "Automatic telephone systems and the like." Siemens Bros. and Co., Ltd., W. G. Patterson, and E. J. C. Rousseau. December 9th, 1924. (243,538.)

30,634. "Apparatus for the supervision and control of the stoppages and diminutions of speed of railway trains, tramways, and the like." E. Rodolausse. December 19th, 1924. (Addition to 162,617.) (243,547.)

31,158. "Electric hand lamps." National Carbon Co., Inc. December 26th, 1923. (226,840.)

1925.

1,187. "Illuminating appliances." W. A. Dorey. January 14th, 1925. (243,559.)

1,259. "Compensated asynchronous motors." Deutsche Werke Akt.-Ges. January 21st, 1924. (228,150.)

2,431. "Apparatus for improving the power factor in an electrical network." Akt.-Ges. Brown, Boveri et Cie. February 2nd, 1924. (228,546.)

3,352. "Electric terminal connection." S. W. Cole. February 6th, 1925. (243,571.)

6,636. "Squirrel-cage armatures for dynamo-electric machines." Deutsche Werke Akt.-Ges. March 25th, 1924. (231,462.)

9,046. "Compensated alternating-current machines." Sachsenwerk Licht- Und- Kraft-Akt.-Ges. April 4th, 1924. (231,895.)

10,486. "Receiving apparatus for high-frequency signals." British Thomson-Houston Co., Ltd. April 25th, 1924. (232,961.)

13,323. "Electrical variable condensers." G. Lombardi. December 10th, 1924. (243,618.)

13,598. "Sparking plugs for internal-combustion engines." A. Lang. May 24th, 1924. (234,522.)

14,031. "Single-axle bogies for rail and tramway cars." A. Kamp. May 28th, 1925. (Addition to 209,593.) (243,624.)

15,514. "Head-lamp control devices." G. H. Soldani. June 15th, 1925. (243,631.)

16,776. "Glass bulbs for electric incandescent lamps or the like and a process for repairing them." Naamlooze Vennootschap Philips Gloeilampenfabrieken. July 23rd, 1924. (237,579.)

17,659. "Variable resistors." A. K. Croad (Amsco Products Inc.). July 9th, 1925. (243,278.)

19,469. "Supports for lamps, particularly for use in street lighting." Benjamin Electric, Ltd., and R. A. Ives. July 31st, 1925. (243,646.)

18,491. "Electrolytic separation of metallic chromium." E. Liebreich. July 21st, 1924. (237,288.)

18,956. "Protective relays." British Thomson-Houston Co., Ltd. August 8th, 1924. (239,216.)

20,266. "Thermionic amplifying apparatus." British Thomson-Houston Co., Ltd. August 15th, 1924. (238,550.)

21,381. "Tanks for electrical transformers and the like." Metropolitan-Vickers Electrical Co., Ltd. September 10th, 1924. (239,845.)

22,150. "Electric discharge devices and means for operating the same." British Thomson-Houston Co., Ltd. September 18th, 1924. (240,149.)

22,757. "Toy electric lamp." I. M. Bennett. September 11th, 1925. (243,291.)

25,247. "Filament supports for vacuum tubes." British Thomson-Houston Co., Ltd. October 9th, 1924. (241,215.)

New Electrical Devices, Fittings and Plant—

Arc-welding set, An improved, 318
Armour plate coal crusher, An, 156
Automobile-engine heater, An electric, 838
Block, A new electric, 198
Boring machine, A new portable electric cylinder, 437
Cable connector, A new, 318
Cable testing plant, A portable, 756
Cable trolley, A low-loading, 955
Cable union, A mechanical, 115
Cartridge for use with an electric iron, A fusible, 437
Circuit breaker, A quick-acting, 77
Clock, A novel electric, 1032
Coal meter, An improved, 479
"Crescent" dish-washer, The, 515
Drawing copying machine, An electric, 515
Drilling machine with four radial spindles, A, 397
Electric-buoy lamp, An automatic, 235
Electric-light bath, An, 77
Extra-high-pressure potential transformer, 76
Fire and electro-vapour radiator, Combined electric, 156
Fitting suspension method, A new, 756
"Flywheel" motor compressor, A, 198
Foundation construction for transmission poles, A new, 115
"Frog" for overhead trolleys, An improved, 955
Furnace regulators, Electric, 115
Furnace repair gun, A new, 955
Fuse, A new design of, 396
"Fuse-blown" indicator, A, 1032
Generating set, A novel, 1032
Grinder, Constant-peripheral-speed electric, 35
Hand pump conversion, A device for, 715
Horn, A new electric, 77
Immersion heater, A new electrical, 318
Insulating material, A new, 756
Insulation for leadless cables, New, 36
Iron indicator plug, Electric, 318
Ironclad switch, A new, 437
Kaye forced-feed oilcans, 838
Lamp fitting, A new, 115
Lamp lock, A new electric, 35
Lamp shades, New designs in, 235
"Mazda" decorative lamps, 1032
Melting pot, An electric, 77
Meter and service switch cabinet, Portable, 235
Motor acceleration device, An automatic, 634
Mule pack radio set, A field, 515
Oil circuit breakers, A new range of, 396
Organ-blowing equipment, An, 635
Powdered "Insalute" (liquid porcelain), 156
Propeller for water-velocity measurement, An electrical, 557
Quick-make-and-break switches, Two new, 235
Reducing valve, An improved, 715
Refrigerator, An electrical, 557
Rotary transformer for battery charging, A new, 156
Sand-pipe heater, An electric, 838
Saw, A portable electric, 714
Shade carrier ring holder, lock and flexible grip, A new, 198
Soldering iron, An improved, 515
Speed controller, New, 756
"Star of Eve" reflectors, 714
Street lighting reflector, A new, 479
Swiss arc welder, A, 198
Switch, A new pattern flame-proof, 1032
Switch and transformer combination, 156
Switch with moulded composition cover, Reciprocating, 235
Switchgear, An improved draw-out, 838
Tap, An electric, 235
Thermofan, The, 35

New Electrical Devices, Fittings and Plant—*continued.*

Tinning and soldering compound, A new, 77
Towel airer and radiator, A combined electric, 437
Transformer truck, A, 558
Waste-heater boiler, A, 955
Windmill, An improved, 318
Wire stripper, An adjustable, 437
Wire wheels, Device for testing, 36

Newfoundland development, English plant at a, 133
New Gallery Kinema lighting installation, The, 265
New South Wales, Licensing contractors in, 696
New York, H.p. Pirelli cable for, 66
New Zealand, A vertical alternator for, 272

Heatrae "LUXOR"
Price 47/6.

Heatrae

SETTING A HIGHER STANDARD IN ELECTRIC FIRES.

VALUE.

We have pointed out that the better finish and appearance of "Heatrae" products generally decides their instant selection by the customer.

There is yet another surprise when values are compared between the "Heatrae" and the "others" that stand beside it.

Value is not the case of a mass-production Fire produced willy-nilly to a price.

Rather—the highest standard yet achieved in electrical Heating at an utterly competitive price

—and therein lies TRUE value.

The Fire illustrated is yet another model from the range of "Heatrae" Fires. The framework is strongly made of polished brass, reflector back of hammered copper, polished and lacquered, and a wood grip lifting handle is provided to give portability. The firebar is instantly removable and replaceable.

STANDARD

INSULATING VARNISHES.

TRADE MARK.

VOLTALAC

After many months of testing, various grades of Insulating Varnish supplied by all the leading makers in the laboratory of a big electrical firm,

STANDARD CLEAR BAKING VOLTALAC (LA)

(SV/11/BC)

won easily on merit, for whereas many firms have produced a clear Insulating Baking Varnish with low acid figures, this had only been done at the sacrifice of elasticity, oil proofing, and drying qualities, all of which protective qualities are retained in the Standard Varnish.

Send your insulating problems to—

Clean Air!

FIT "Visco" Air Filters to the air inlets of your Alternators, Motors and Air-cooled Transformers. These will remove 98% of the dirt with which the atmosphere is charged. If this is done the plant will be more efficient, because it will be clean *internally*, and working temperatures will be reduced.

The VISCO AIR FILTER

is a standardised unit applicable to the ventilating systems of buildings of every size, and plant of all types. It is the simple and most efficient Filter known, and the cheapest in the long run.

A British Ambassador being received by a 16th century Eastern Potentate

The Tudors of England

IN Tudor Times expansion of Trade often depended largely upon assistance received from ruling princes. Concessions from one Monarch to another and Royal Charters all played their part in the great game of foreign commerce.

To-day, however, we rely upon the sterling merit of the goods we manufacture to obtain and maintain our overseas trade. And the marked preference for British Made goods is nowhere more strikingly displayed than in the world of Accumulators.

In the Colonies and abroad, whether for POWER STATIONS or TRAIN LIGHTING, ELECTRIC TRACTION or WIRELESS, Tudor Accumulators have for many years past maintained their position by one quality:

COMPLETE RELIABILITY.

Use "DEXINE" Instead of Rubber

Survival.

In the struggle for existence only the fit survive. It is possible for a cheap substitute to masquerade as the real thing—but not indefinitely. "DEXONITE" survives—where so-called Ebonites are swept away—because it is fit for the job.

"DEXONITE" is a hard rubber compound, absolutely proof against acids, alkalis and changes of temperature. It is not brittle, is a perfect insulator and resists high voltages. It takes a fine thread and a good polish.

"DEXONITE" can be moulded to any shape. It has 101 uses, a few of which are for rods, tubes, sheets, ball valves, handles, acid pipes, swivel sockets, bends, back nuts, cylinders, radiator cap fillers, and all kinds of wireless uses.

DEXINE LTD.

SILENCE

SILENCE in running is an important factor in a motor. Bull Motors make a special feature of this point in the production of their Motors and Dynamos, hence the reason for the large orders received from the Organ-Blowing equipment firms. To cite examples : Bull motors are installed in the Royal Albert Hall and Westminster Cathedral.

Open Bracket, Enclosed Ventilated, Totally Enclosed, or Pipe Ventilated machines, can be supplied in all standard voltages up to and including 100 Horse Power, fitted with plain, Ball or Roller Bearings as required.

Quick Deliveries.

Get your Screws and Machined Parts from the finest Screw Plant in the Kingdom

We specialise in turning Brass and Steel Screws and Machined Parts and Accessories of all descriptions.

SERVICE of the kind you need is certain to be forthcoming from an engineering house of world-wide scope, with 25 years' specialised experience in the British manufacture of precisely turned screws, machined parts and accessories of all descriptions.

In town after town the most critical traders have adopted the ORMOND SERVICE.

This SERVICE means that you are always quoted the lowest prices—prices lower than any in the trade—lower by far than from foreign sources. **It also means a guaranteed delivery date.**

Our new 1926 Catalogue is now ready. Write for a copy and our Trade Terms.

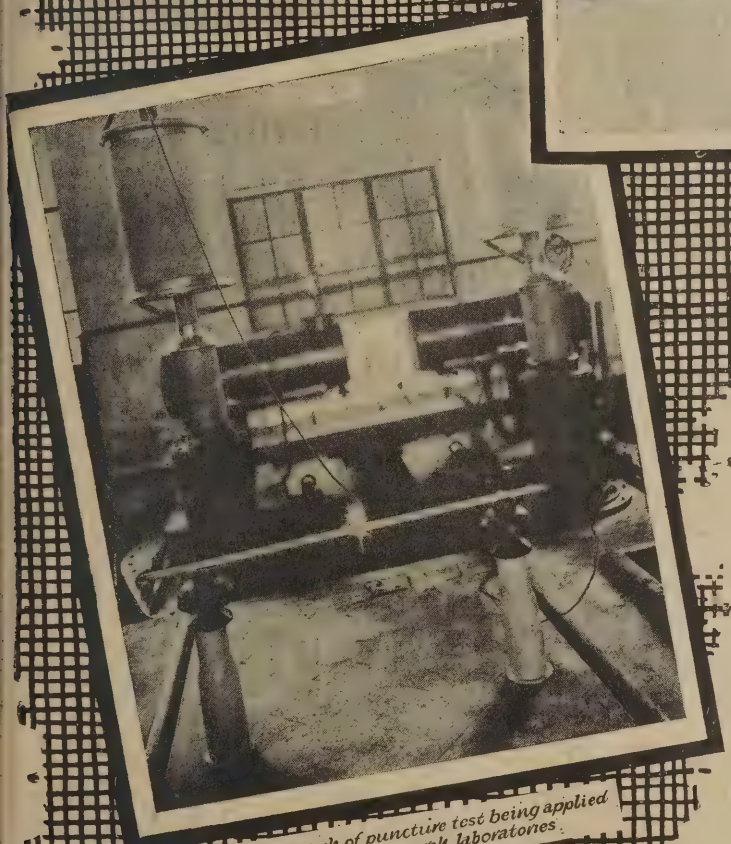
ORMOND ENGINEERING CO.



25 Years' British Manufacturing Experience

Micanite covered tube being lifted from water tank where it had lain for 2 years

Deposit from water on tube

Photograph of puncture test being applied at our research laboratories

TWO YEARS UNDER WATER

The Micanite covered steel tube shown in the photograph is a standard tube as used in the Henley Unit. For research purposes it was placed in a tank of water two years ago and the resultant deposit from the water is shown in the centre illustration.

After superficial drying electrical pressure was applied until breakdown occurred at 17·5 K.V. This remarkable result demonstrates the excellent insulation properties of the Henley Unit even under most unfavourable conditions and helps to explain the continued and increasing demand for such apparatus.

The Henley Unit can be built up into Distribution Pillars or Substation Panels to suit any A.C. or D.C. System of Distribution. Fuse Units for 60, 150, 300 and 500 amps. and Link Units up to 1,000 amps. can be assembled from standard parts.

Complete details and prices are given in Catalogue W.A. 1, a copy of which we shall be pleased to send you.

What's in a name?

The question is often asked, and has been answered in various ways. There are those who maintain that the correct answer is "Nothing," while others consider that a great deal depends on a name. We associate ourselves with the latter, so far as Greengate Cables are concerned, for the name "Greengate" is a guarantee of the finest construction and quality in cables, and of an organisation of service which has secured for us a well deserved popularity. We should like ***you*** to benefit by this service. Let us have your next order, however small, and see for yourself the advantages we offer.

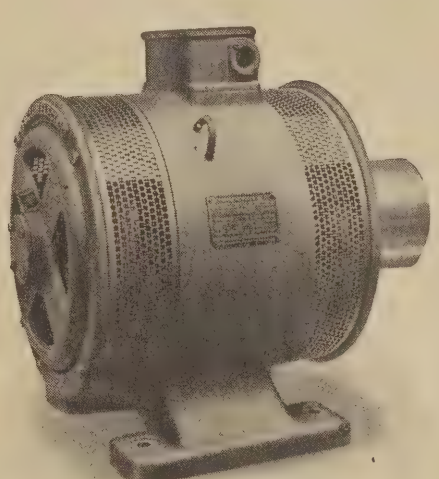
MOTORS "English Electric"

for INDUSTRIAL DRIVES

MOTOR DRIVING EXTRACTOR FOR CARBOLIC PLANT.

MOTORS DRIVING PULVERISERS.



MOTOR DRIVING STRAIGHTENING ROLLS.

No matter how difficult or unusual the drive, "English Electric" Motors will fulfil the demands of varied industrial conditions and give entire satisfaction to the user.

Our Bradford Works is the largest in the country devoted exclusively to the manufacture of Industrial Motors, and is equipped with every refinement of plant and organisation which can ensure uniformity in the materials, accuracy in workmanship, and thoroughness in inspection.

To mention only one of the many attractive features embodied in the design of "English Electric" Motors, i.e., that of *Ball and Roller Bearings*—this type of bearing has the following advantages :—
(1) Practically no wear over period of many years ;
(2) Elimination of troubles due to oil throwing ;
(3) Attention required for lubrication reduced to a minimum.

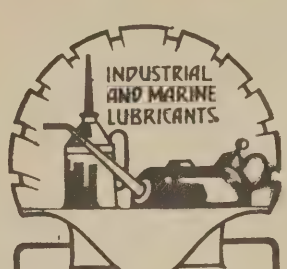
Head Office: Heaton Works, Newcastle on-Tyne.

London Office: 56, Victoria St. Westminster, London, S.W.1.

Where can you find better viscosity?

Radiating surfaces alone are not sufficient to dissipate the heat produced by the energy losses which occur in the winding of a transformer. The function of transformer oil is to disperse that heat from the transformer proper to the casing.

The more sluggish the oil, the slower will be the circulation around the windings and cooling surfaces. Viscosity determines circulation.



The viscosity of Shell Transformer Oil "K-1" averages 129 seconds at 60° F. Where can you find lower and more efficient viscosity, combined with full compliance with all the other B.E.S.A. requirements? "K-1" ensures rapid circulation and therefore effective cooling qualities.

The wide sale of this ultra fine oil has made possible an unusually moderate price. Send for a quotation, sample and certified test figures.

AND A NEW TURBINE OIL, TOO, FROM THE SAME SOURCE AS "K-1."

At the same time let us send you a sample of the new Ultra Turbine oil. Prepared from a *special Crude* by a new refining process, it has remarkable resistance to emulsification, and does not throw dowr deposits which might lead to stoppage of the oil-ducts.

Western Electric

PAY FOR EFFICIENCY— WHERE EFFICIENCY PAYS

THE duty of a Condenser is to lose heat—and to save heat.

It must lose quickly and at the lowest economical temperature the latent heat of the steam exhausted into it.

And it must conserve to the maximum degree the heat in the condensate returned to the boilers.

Its success in meeting these contrary requirements with the minimum operating cost is the measure of its efficiency.

The diagram illustrates that in a given case about 50% of the energy in the boiler steam is rejected to the condensing plant.

Clearly therefore, it is in the region between turbine exhaust and boiler feed that there is greatest scope for operating economies by the use of high efficiency plant.

We specialise in this important field, and it will pay you to obtain our proposals and technical guarantees on your next job.

We will quote direct, or through turbine builders (as sub-contractors) as you wish.

BENJAMIN ELLIPTICAL ANGLE REFLECTOR *for* SHOP WINDOW LIGHTING

More Attractive Windows :: Less Equipment :: Less Current Consumed

Side View.

Front View.

THE Benjamin Elliptical Angle Reflector is particularly designed and suitable for the interior lighting of Shop Windows, Switchboards and other interior locations.

Its superiority lies in the fact that, in addition to a heavy flux of light directly in front of the reflector, the elliptical design provides a wide distribution horizontally and builds up the illumination "in between." Even distribution of light and greater attractiveness are assured with fewer lamps, less current and lower upkeep.

The fitting is made in heavy gauge steel, vitreous enamelled green outside and white inside, and supplied with $1\frac{1}{8}$-in. hole at top for attaching to ordinary shade carrier lampholder.

A typical Benjamin Elliptical Angle Installation.

Fine Workmanship.

In these days of mass production fine workmanship is often at a discount, to the detriment of accuracy; and accuracy is undoubtedly the most important quality that a measuring instrument can possess.

In our works we have old and valued employees who have been with us many years and are masters of their craft.

As instrument makers they have no equal. They belong to an era when indifferent workmanship was considered discreditable; and to-day they still preserve their high standards of excellent work.

This may also account for our very competitive prices, for the man who is master of his craft will always do the job twice as well as the man who is not, and in half the time.

Our Catalogue may be had on application and will certainly interest you if fine workmanship coupled with competitive prices can assist you in any way at all.

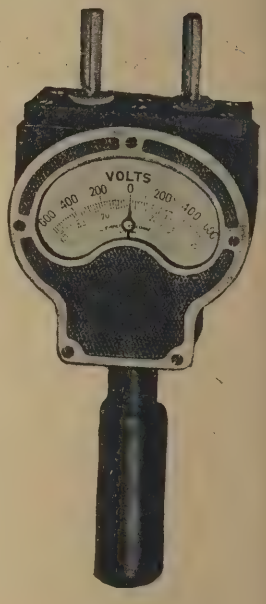
PARALLELING VOLTMETERS



Direct and Alternating Current.

Paralleling with two voltmeters, one connected to the incoming machine and another to the busbar, has several disadvantages from the standpoint of convenience and accuracy.

A single instrument which shows the equality of the voltages is a quicker and more accurate method.

The Portable Paralleling Voltmeter illustrated, when connected across the main switch, is a handy little instrument for D.C., while the Sector pattern shown, when used in conjunction with a Rotary Synchroniser, is all that is necessary for A.C.

Both instruments possess the following advantages:—

Great Sensitiveness.

Open scale at the working point.

Paralleling accuracy is independent of the calibration.

ALTERNATING CURRENT MOTORS.

SQUIRREL CAGE TYPE.

It is recognised that the Squirrel Cage machine presents the simplest form of Power Unit. Simplicity carrying with it its usual advantages of freedom from mechanical troubles.

Squirrel Cage Machines ensure economy in upkeep, control gear, wiring and upkeep.

Veritys Squirrel Cage motors are well known for easy running, long life and heavy duty without fear of breakdown. They are made with either ball or roller bearings according to size of machine, and conform to the British Engineering Standard Specifications.

They have accessible connections with good solid lugs for wiring and are easily mounted. They reduce those "Little wiring troubles" to a minimum. Write for specifications and catalogues.

We are also manufacturers of

SLIP-RING MOTORS

and a complete range of D.C. motors and dynamos from ¼ H.P. upwards with switch gear to control them, also Fans of all types, including the new "Orbit" fan. Sectional catalogues upon request.

HOME OFFICE REGULATIONS

SECTIONAL LIST ON REQUEST.

Adopted by the Leading Engineering Firms, Shipyards, Corporations and Government Departments.

AN EXTRACT FROM THE PRESS.

FATAL ELECTRIC SHOCK DUE TO USING AN UNSUITABLE HANDLAMP.—For breaches of the Factory Act, the ——— Co. were fined Two Guineas in each case by the Manchester County Magistrate to-day. F. B. Pollard, Inspector of Factories, said that in August an Electric Lamp in use in the works did not comply with the regulations. The holder was in metallic contact with the guard, and later a foreman who handled it *received a shock which proved fatal.*

Accidents caused through the use of badly designed Hand Lamps, some of which have resulted fatally, prompted us among the first to introduce a thoroughly safe Hand Lamp. A feature of these Hand Lamps is their strength and safety and particularly massive galvanised guard.

"GUARDIAN," Type G1 (as illustrated). Complete with massive Galvanised Guard and Holder. **7/6** each.
Type G11 as type G1 but fitted with Well Glass **10/6** ea.

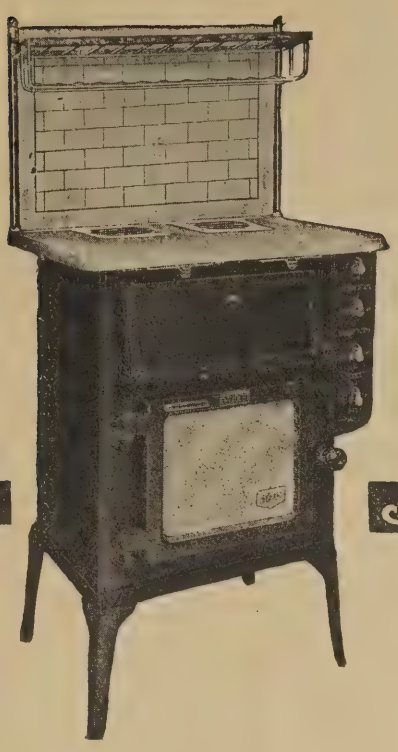
Making History in A.C. Motor Construction

1 IN 4

Twelve years ago when we designed our present works we were untrammelled by convention or custom, and we planned those works to make the finest A.C. motor in the country with the lowest production cost.

To-day, the results of that plan are being felt. One in every four A.C. industrial motors sold in this country is made at our works.

No better motor than the Parkinson is made, yet it cannot be approached within 30% for price.



If you are on A.C. supply, buy Parkinson.

LEEDS

SIMPLE, RELIABLE, THOROUGH THROUGHOUT.

Another "Revo" Success.

List No.
F. 4772.

The FAMILY COOKER

Suitable for a family of 6 to 8 persons.

SPECIAL FEATURES.

BOILING PLATES.—These are the new "Revotherm" (Prov. Patt.) protected open type plates, immediately removed by loosening three nuts. They are exceedingly efficient, accident proof, quick boiling and entirely reliable.

HOTCUPBOARD.—The space between the oven and boiling top is provided with a drop door, forming an excellent warning chamber.

WIRING.—This is carried out by means of solid copper bus bars on porcelain insulators—no wiring coming into contact with the lagging material.

SWITCHES.—These are of the pointer reciprocating type protected by a cast iron switch plate upon which are clearly embossed the indications.

FUSES.—A trap is provided in the switch and wiring cover giving easy access to the fuses, yet protecting them from damage.

THE WHOLE is a sound engineering job, electrically and mechanically.

SPECIFICATION.

All controls are 3-heat.

BRIGHTRAY & GLOWRAY

NICKEL CHROME

WIRES & TAPES

are prepared by special melting and refining processes and are the purest alloys on the market. They are rolled and drawn **BRIGHT** but are sent out to customers with a firmly adherent black oxide coating. This oxide film which forms when ***bright*** wire is heated in air or pure oxygen is highly refractory and acts as a protecting and insulating covering.

BRIGHTRAY and **GLOWRAY** wires and tapes can be supplied **BRIGHT,** but we strongly advise the normal treatment described above since all nickel-chromes turn black on first heating to redness and in so doing alter their electrical properties thus introducing a factor of error in design calculations. Manufactured from the raw material by

The One of J&P Pages

IN these days of rapid movement and strenuous endeavour it is well that we should call a halt occasionally and renew acquaintance with the customs of less exacting years.

In all the year no better opportunity presents itself than the coming of that festival we know as

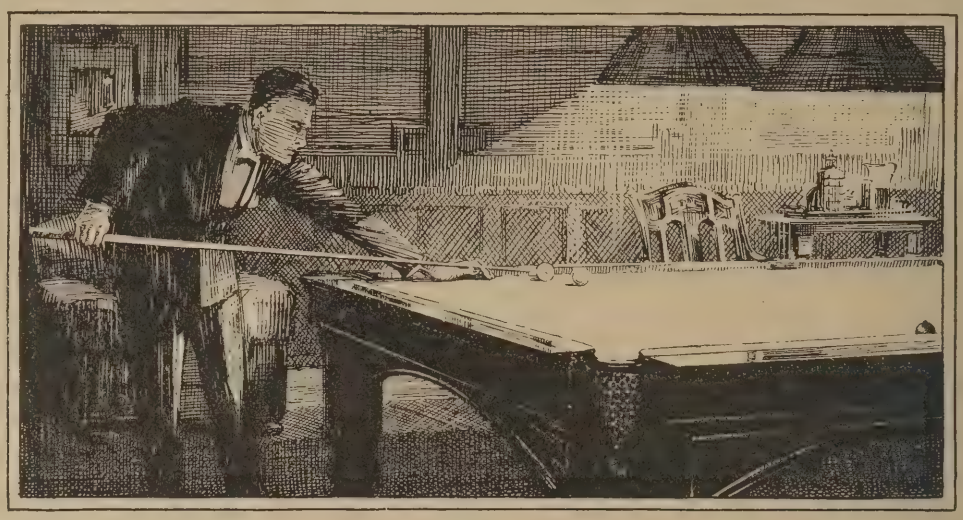
Christmas

The mark that means that "little more" in quality

The One of J&P Pages

WHEN does the spirit that is old but ever new inspire us – then is the golden rule ever in our minds and its fulfilment reflected in our speech and actions – then the things that really matter in "the everyday" become subordinate and we rejoice not in the business we are doing but – in the friendships which we make in doing it.

We have made many such friends, and to one and all to-day would broadcast our message of goodwill in those old familiar words –



A Merry Xmas and a Prosperous New Year

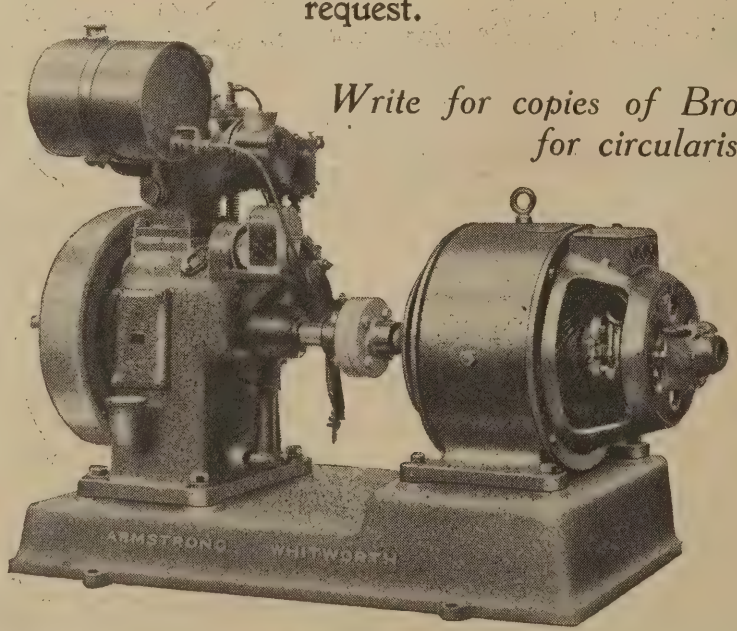
Fair Trading?

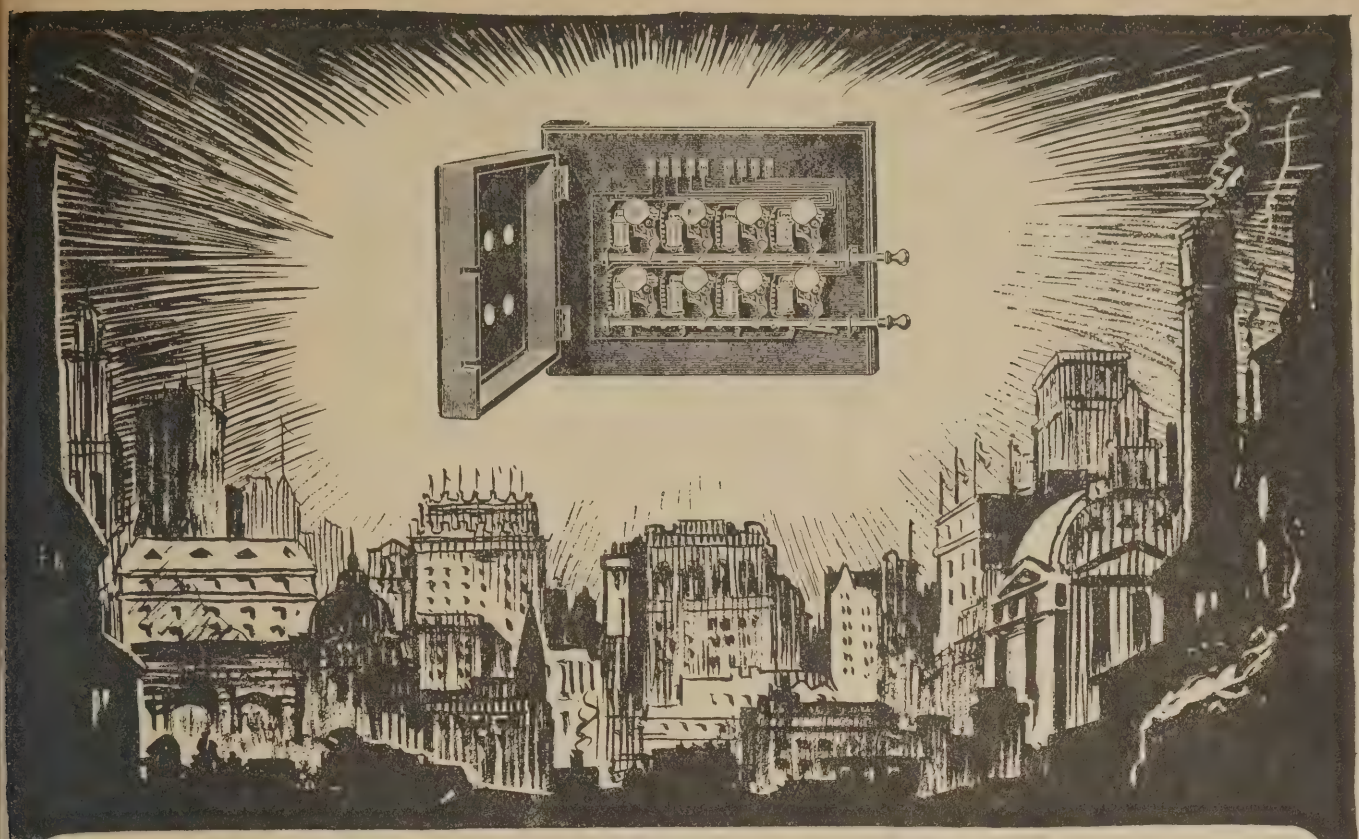


WE have signed the N.E.C.T.A. agreement under which we allow trade discounts only to recognised contractors.

We do not encourage direct retail sales, but make a practice of forwarding private enquiries to suitably situated firms.

If you order A.W. plants you will receive your share of such enquiries.

Our Catalogue gives full details of standard engines and sets, and will be forwarded on request.



Write for copies of Brochure No. 338 for circularising.

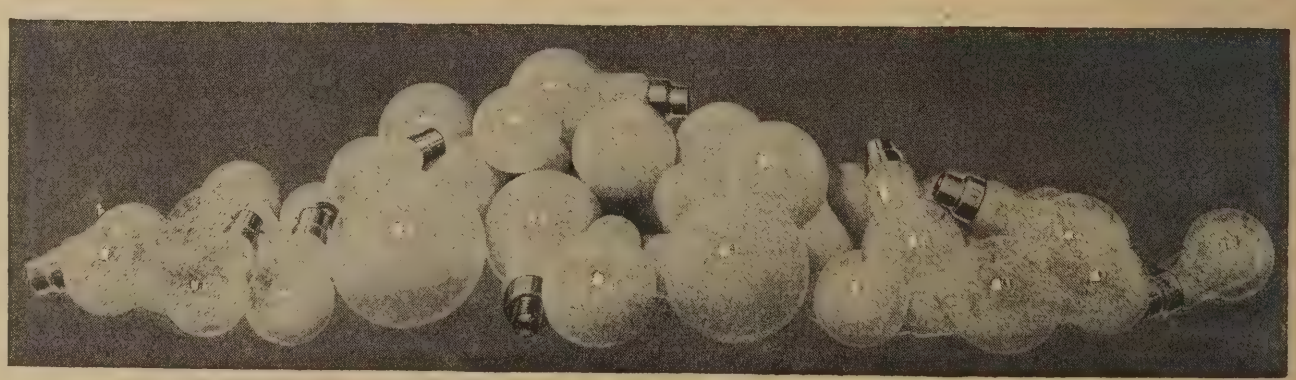
A SALES HELP!

THE Retailer who illuminates his own shop window and shop with the latest types of electric lamps is helping himself to sales. The lamps, however, must be right in performance and appearance. Therefore he should use



ROYAL

"EDISWAN" FULLOLITE

The lamp in the opal glass bulb, with the inner lining of clear glass. No glare, no harsh shadows—perfect light diffusion. Royal "Ediswan" Lamps command a ready sale. Stock them and sell them.

The Edison Swan Electric Company, Ltd.,

123/5, Queen Victoria Street, E.C. 4.

Everything for Wireless!

WIRELESS should be a profitable side line in the electrical contracting business. But the goods should be reliable, well-designed and British.

EDISWAN

WIRELESS SETS AND PARTS

are soundly designed and carefully manufactured and can be relied upon to give the greatest possible satisfaction to your customers.

SWITCHGEAR SPECIALISTS

All over the world

OUR policy of specialising exclusively in Switchgear of all types has amply justified itself. Throughout the world the word "Ferguson-Pailin" is synonymous with "Switchgear Specialists," and whenever a new installation is being laid down, the robustness and excellent design of our products compel attention.

We illustrate a remote mechanically operated switchboard supplied to the Great Indian Peninsula Railway for controlling the main power supply at a pressure of 22,000 volts. The gear is of the metal-clad "vertical" pattern, a type which has received our particular attention in recent years.

We shall be glad to answer enquiries which may be sent to any of our Branch Offices, or to our Head Office at Manchester.

SITUATIONS VACANT.

Latest time for receiving, 5 p.m. Tuesday.

If letters are not to be delivered to certain firms or individuals (if known), instructions to that effect should be sent to the Manager of the ELECTRICAL REVIEW, who will do his best to carry out such instructions. Letters of applicants cannot in such cases be returned to them, nor can the names of Advertisers using a number in any way be disclosed.

Original Testimonials should never be sent.

COUNTY BOROUGH OF WALLASEY.
Tramways and Motors Department.

ROLLING STOCK AND WORKS SUPERINTENDENT.

THE Tramways Committee are prepared to receive applications for the position of Rolling Stock and Works Superintendent.

Applicants must be thoroughly qualified engineers with experience in a similar capacity, and be fully conversant with all details of electric tramcar building and repairs. Commencing salary £300 with house and light, rising to £350, subject to a reduction of 3 per cent. in accordance with the provisions of the Council's Superannuation Scheme.

The person appointed will be required to pass a medical examination, and to devote the whole of his time to the duties of the office.

Applications must state full particulars of qualifications, present position, past experience, and enclose copies of not more than three recent testimonials.

Applications to be endorsed "Rolling Stock Superintendent," addressed to the undersigned, and forwarded through the post so as to be received not later than Monday, the 11th January, 1926.

By Order,
GEO. LIVSEY,
Town Clerk.

Town Hall, Wallasey.
December 16th, 1925. 3802

PETERBOROUGH CORPORATION.
Electricity Department.

THE services of an Engineer Clerk-of-Works are desired to superintend the construction of the new electrical power station at Peterborough. Only applications from candidates having considerable experience in the actual construction of modern power stations will be considered, and the application should state fully the qualifications and experience in this particular class of work of the candidate. It should also state the salary required.

The appointment will be for approximately twelve months, and the selected candidate will act as an assistant to and under the control of the City Electrical Engineer.

Applications, endorsed "Clerk-of-Works," should be addressed to the City Electrical Engineer, Albert Place, Peterborough, and will be considered on approximately January 1st.

3752

COUNTY BOROUGH OF NEWPORT.
Electricity Department.

REQUIRED immediately, Switchboard Attendants for power station. Wages, £3 6s. 7½d. per week of 48 hours and subject to adjustment under the D.J.I.C. (Electricity Supply) Schedule. Only experienced operators who have been employed on d.c. and extra high tension three-phase switchboards need apply. Applications with testimonials (copies only) should be sent in at once to the undersigned.

A. NICHOLS MOORE, M.I.E.E.,
Borough Electrical and Tramways Engineer.

Town Hall,
Newport, Mon.
December 18th, 1925. 3808

SITUATIONS VACANT.—*Continued.*

BECKENHAM URBAN DISTRICT COUNCIL.

Electricity Department.

APPOINTMENT OF ASSISTANT CLERK (MALE).

APPLICATIONS are invited for a Clerk in the Offices of the above Department at a commencing salary of £85, rising by annual increments of £10 to £125, plus temporary bonus on the Civil Service scale, at present amounting to £63 15s.

Candidates, who should be approximately 22 to 30 years of age, must hold a certificate of one of the recognised Examination Boards, must be shorthand typists, and have had experience either in a similar electric supply office, or in that of a wiring contractor.

The successful candidate will be required to pass a medical examination, and must contribute towards the Council's Superannuation Scheme, now under consideration, should such come into being.

Applications, in the candidates' own handwriting and accompanied by copies of recent testimonials, should be delivered to the undersigned not later than Saturday, January 2nd, 1926.

J. E. TAPPER,
3820 Engineer and Manager.

LYME REGIS BOROUGH COUNCIL.

ASSISTANT Engineer required in Electricity Department. Must be capable of taking "Shift" duty in a semi-Diesel three-wire station; must also have some mains experience and be capable of jointing l.t. cables.

Reply, stating age, wages required, and enclosing copies of testimonials to

A. BROWN, A.M.I.E.E.,
Borough Electrical Engineer.
Lyme Regis. 3807

CAPE TECHNICAL COLLEGE, CAPE TOWN.

APPLICATIONS are invited for the post of Senior Lecturer in Engineering at the above College. Commencing salary according to experience.

Applications in duplicate on the prescribed forms (to be obtained from the undersigned) will be received up to the 10th January. They should be accompanied by certified copies of testimonials of practical and teaching experience, and should state age of applicant. The appointment will be subject to Conditions of Service, a copy of which will be supplied on application.

Applications and enquiries should be addressed to Messrs. Chalmers, Guthrie & Co., Ltd., 9, Idol Lane, London, E.C.3. 3801

ELECTRICAL TRADES UNION.

Hackney Borough Council.

THE Hackney Borough Council has been declared "Black." Before any member of the Electrical Trades Union can accept any employment, either directly or indirectly, for this Council he must first obtain permission from the London District Committee of the Electrical Trades Union.

CHRISTMAS LAMPS! COLOURED LAMPS!

IT is not too late to buy Decorative Lamps. They will be needed for weeks yet for all kinds of festivities. Some, indeed, are used the whole year round. Do you, Mr. Contractor or Mr. Retailer, obtain your fair share of these orders—and, if so, are you content with the usual meagre profit? If you prefer 100 per cent. profit on excellent lamps, drop us a line immediately.

HEADPHONES! Special Offer.

Splendid quality, excellent finish, sensitive. Only 6s. per pair, C.W.O., or in dozens, 5s. 9d. per pair, C.W.O.

Our Wireless Department has a number of lines equally attractive. Send a p.c. for our list.

BELBIN & BOWDEN, LTD.,

HOW HACKBRIDGE TRANSFORMERS ATTAIN THEIR MATCHLESS EFFICIENCY

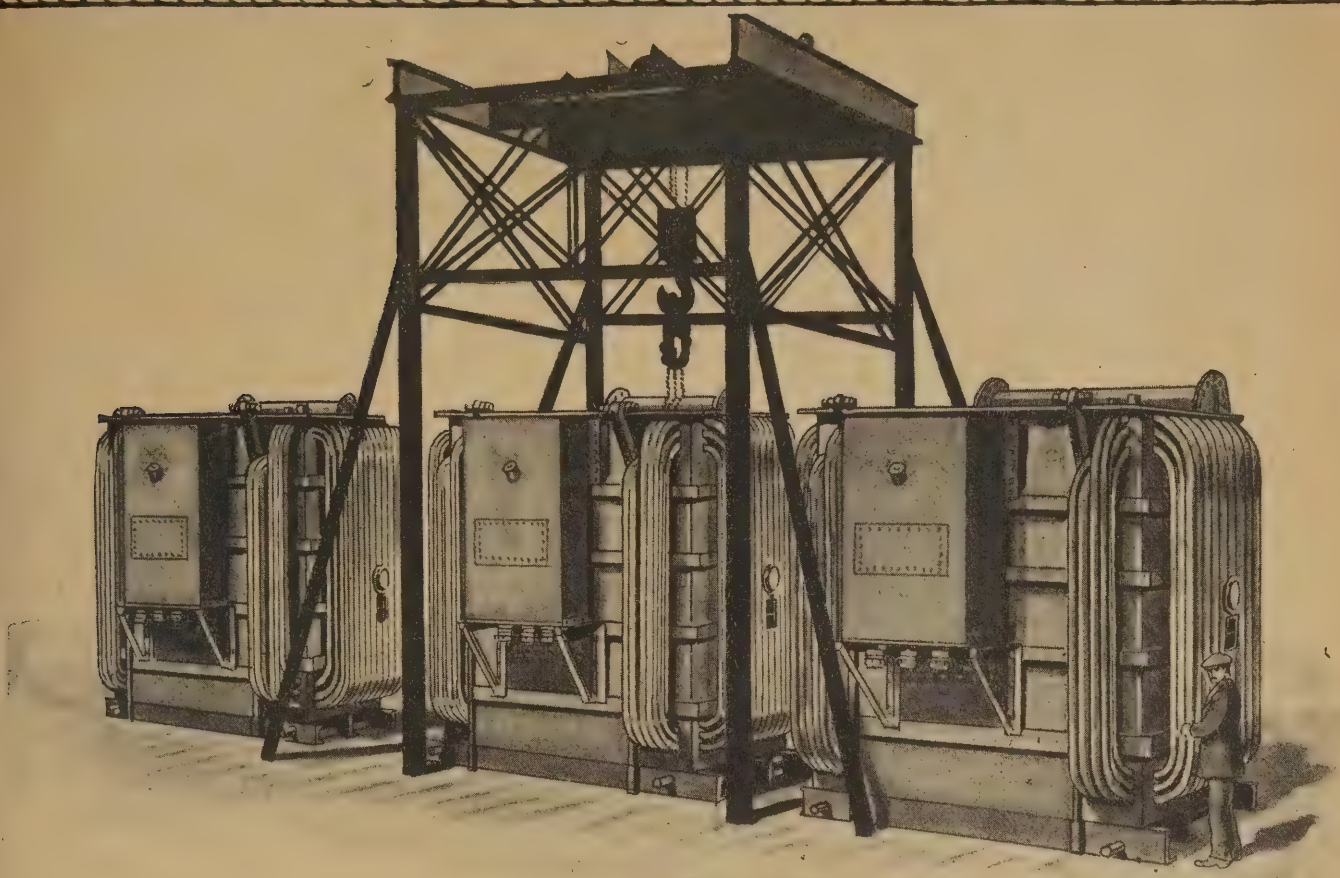

Illustration depicts the 7,500-K.V.A. Bank of Hackbridge Transformers installed at the Valley Road Station of the Bradford Corporation. The Transformers step up from 6,300 volts to 49,500 volts, three-phase, 50 cycles.

No 6 Operation

THE final test of a Transformer is its operation, and to ensure satisfaction and safeguard against the development of trouble, the general operation of the unit should be very carefully observed.

The ability of a Transformer to withstand heavy and continuous overloads without undue heating is dependent upon the electrical and mechanical design—such details as the disposition of the ducts and their dimensions, and the mechanical bracing of the coils being of primary importance.

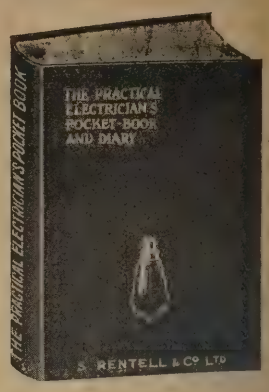
Periodical examination of oil samples should be made and the colour and condition noted, as these will infallibly indicate the loading conditions to which the windings have been subjected.

Customers need only forward us a sample of the oil taken from the bottom of the tank, and the Test Department will submit a report upon the condition of the sample. This service is granted with any Transformer, whether large or small.

Hackbridge Transformers are liberally designed to withstand the most *arduous service and conditions in operation.* Witness to this the growing list of Clients in this Country and the Colonies, and who specify Hackbridge Transformers in their repeat orders.

If you are interested in Static Transformers, send us your Name and Address, and we will mail you a copy of our Catalogue, and register you to receive our periodical technical literature.

HACKBRIDGE TRANSFORMERS



A new Hackbridge Transformer Booklet is in course of production. We will gladly put any interested Executive Engineer on our mailing list on receipt of address.

Five Reasons Why

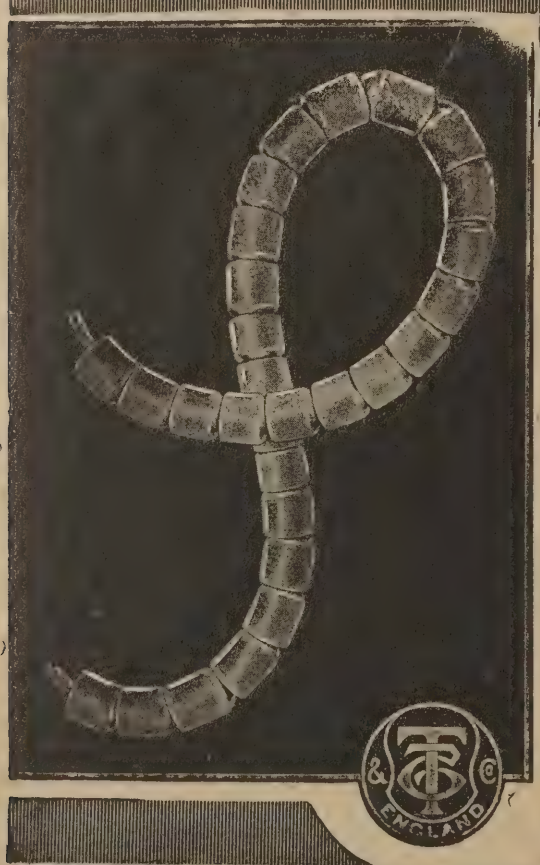
You should now order your 1926 Edition of

THE PRACTICAL ELECTRICIANS' POCKET BOOK AND DIARY.

1.—The sections dealing with D.C. Generators and Motors, A.C. Theory and A.C. Generators have been entirely re-written at considerable length by G. W. Stubbings, Esq., B.S.C.

2.—There are three new chapters on Power Factor Correction, Localisation of Cable Faults and A.C. Protective Systems.

3.—Electricity in Coal Mines has been brought right up-to-date by E. Dinsdale Phillips, Esq.



4.—The Section on Illumination and Lamps by W. J. Jones, Esq., has been revised and the ELMA list of Standard Lamps included.

5.—The list of Central Stations giving Voltages, System, Price and the Chief Engineers of over 1,300 different towns in the United Kingdom has been most carefully revised and should prove invaluable to the manufacturer and all who deal with Power Stations.

Bound in good quality stiff red cloth covers, this "mine of information" can be obtained from newsagents or direct from the publishers for **3/-** net or **3/4** post free.

S. RENTELL & CO., LTD., 36-38, MAIDEN LANE, LONDON, - - W.C.2.

THE Solution of the Problem OF BARE WIRE INSULATION

HERE is the perfect fire-proof flexible Insulation for Motor Starters, Regulators, Controller Resistances, &c., &c.

"FISH-SPINE" BEADS

(Regd. Trade Mark)

are a British-made Product, and are supplied to

The Admiralty and Leading Manufacturers of Electric Fires, Cookers, and all allied apparatus.

"Fish-Spine" Beads afford the most satisfactory methods ever devised of dealing with Bare Wire Insulation.

TRIOTRON

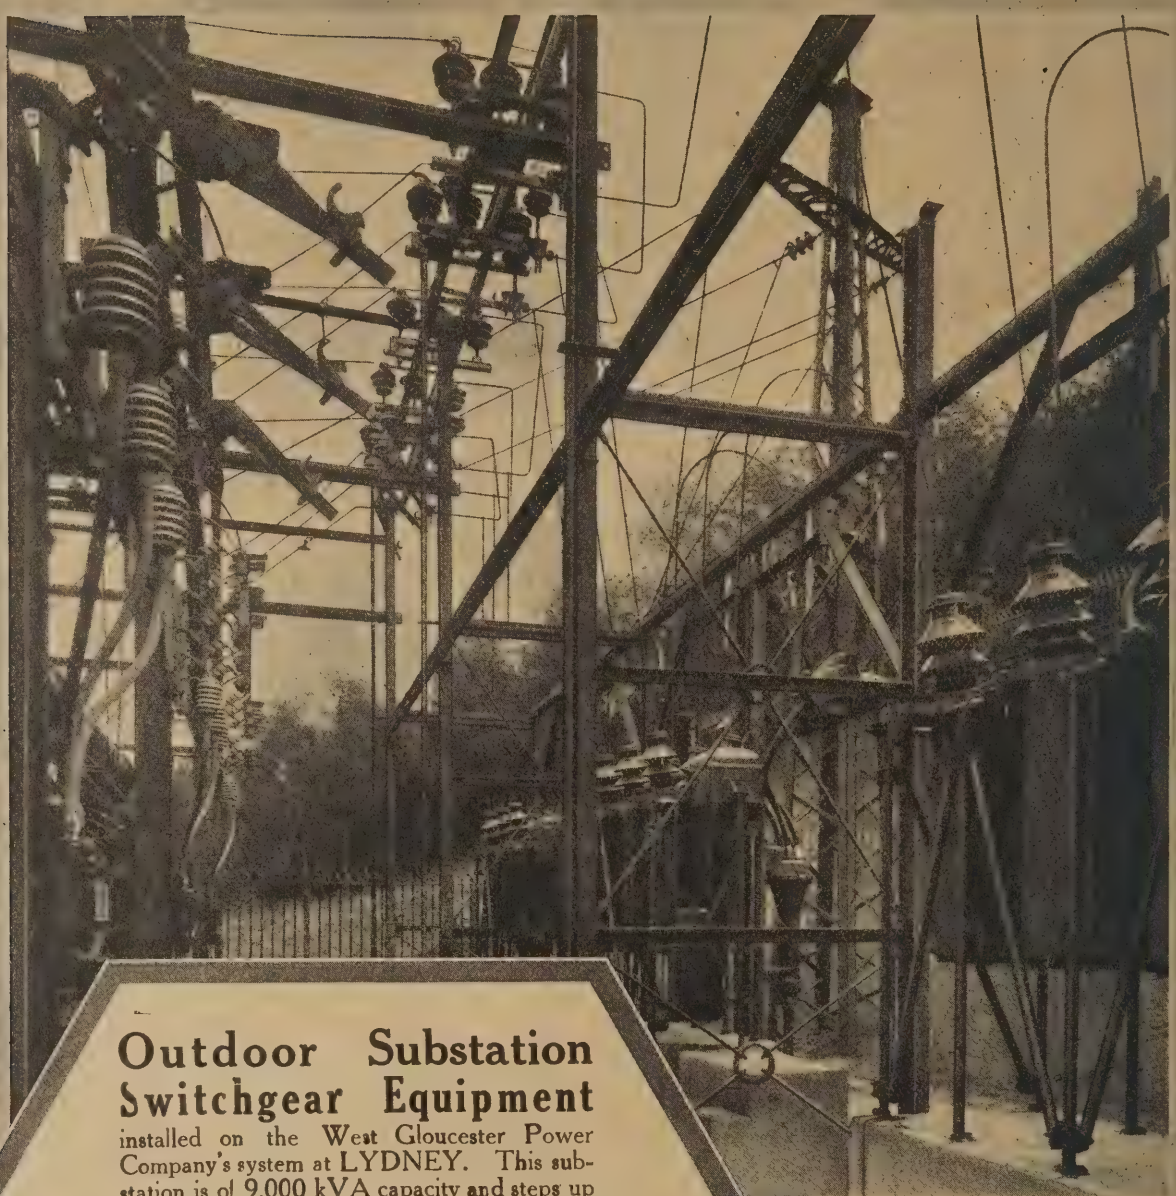
VALVES

(Made in Austria).

The only "Non-Ring" Valve of quality that counts.

(Genuine Amplifiers).

TRIOTRON Valves are prominent among those very few Continental valves that meet the requirements of the English market for really efficient Loud-Speaker Valves.



Insist upon getting quotations and samples from your Factor for the following types:

POWER VALVES	FILAMENT VOLTS 3·5-4.
For Large Loud Speakers.	FILAMENT CURRENT 0·3 Amp.
DULL EMITTERS	FILAMENT VOLTS 3.
For High & Low Frequency Amplification.	FILAMENT CURRENT 0·06 Amp.
SEMI-DULL EMITTER	FILAMENT VOLTS **1·8.**
For High & Low Frequency Amplification.	FILAMENT CURRENT 0·2 Amp.

These two latter types give perfectly satisfactory service for Table Loud Speakers.

All TRIOTRON Valves are exclusively made with Platinum leading-in wire.

N.B.—TRIOTRON Valves have enabled the Trade to supply to the public a high-class Valve within the means of everybody, and have thus promoted the use of Valve Sets in preference to Crystal Sets.

Outdoor Substation Switchgear Equipment

installed on the West Gloucester Power Company's system at LYDNEY. This substation is of 9,000 kVA capacity and steps up from 6,600 volts to 33,000 volts. This is a

"MetrovicK"

equipment and is the first installation of its kind in this country, which embodies **ALL BRITISH MANUFACTURES.**

THE Mark of Efficiency.

The equipment consists of :—

Type G.11 Oil Circuit Breakers 400 amp.
Type I.B. ... ... Horn Break Switches.
Type D.Q. ... ... Isolating Switches.

EDISON SWAN ELECTRIC CO., LTD.

Forty-second Annual Meeting.

THE 42nd ordinary general meeting of the company was held on December 16th at the Cannon Street Hotel, E.C., the Chairman of the Company (Mr. C. F. Spencer) presiding. The Secretary having read the notice convening the meeting, the Chairman rose to move the adoption of the directors' report and accounts. In the course of his speech Mr. SPENCER said that there were two meetings to be held, but he would deal with the whole of the business at once. The authorised capital of the company was £432,565 8s. 0d., of which £141,130 was in shares of £1. It was proposed to convert these shares into 4s. shares to have the whole of the ordinary shares of the same denomination. It was also intended to modernise the Articles of Association. There were two classes of debenture stock and of this £248,579 of the first debentures was outstanding, as well as £55,034 of second debentures, apart from £200,000 of second debenture stock which was lodged with their bankers as security for a loan. It was quite likely that under a scheme of arrangement between the debenture holders, the Board would endeavour during the current year to consolidate the then outstanding debenture stock of both classes, and thus effect a reduction of loan charges. Their bankers, the National Provincial Bank, Ltd., had been a tower of strength to them during the past three years. The amount owing to the Bank had been reduced from £314,150 to £110,000, since November, 1922, when the present Board took office. In addition to decreasing the floating debt they had reduced the long-term first and second debenture stock by £26,606. Sundry creditors and credit balances showed an increase reflecting the increased trade enjoyed by the company during the year. The reserve account stood at £80,000 at the close of the last year and it was proposed to add a further sum of £50,000. The aims of the Board had been to rapidly discharge the loan obligations and to build up an adequate reserve fund. Debt had been discharged to the extent of £230,756, and this would be further augmented shortly by further utilisation of the sinking funds. The reserve, amounting to £130,000, could not be considered entirely inadequate. After paying the preference dividends and one of 10 per cent. on the ordinary shares, and transferring £50,000 to reserve, there remained £11,700 18s. 9d. to be carried forward as compared with £17,575 1s. brought in. In augmenting the reserve and carry forward they were endeavouring to consolidate the finances of the company. The item "Patents, goodwill, &c.," had been written down by the amount of the debentures redeemed during the year, *viz.*, £26,606, and it was hoped to further reduce the item. Referring to the company's products, the Chairman said that the "Fullolite" glareless lamp had become very popular, as had their radio sets and valves. He asked shareholders to use and recommend "Ediswan" goods. The investments at cost included at least one item, shares in another company, which was worth twice the amount set down. The fixed assets showed little change except that motor vehicles had been purchased to strengthen the company's distribution system. The amount set down for sundry debtors (£194,158 16s. 8d.) might be considered as wholly collectible. With regard to the current year, Mr. Spencer said that the profits to November last were quite satisfactory, and they were getting a satisfactory share of the available trade. They had continued their policy of reviewing the company's activities and economies had been effected by reducing both productive and non-productive expenditure. Although the company was on the road to prosperity there was one factor which might react unfavourably upon its business, in common with that of other concerns; that was the subsidised competition of foreign manufacturers. The subsidy took the form of depreciated exchanges; lower taxation; the evasion of payment of war debts on which we had to pay interest; the installation of machinery and plant at low capital cost; and the longer hours worked by their operators. The foreign manufacturer's standing charges were lower than ours. These were stubborn facts which had to be faced. There was, however, some reason for hope. The Treaty of Locarno was bound to help in the restoration of confidence in Europe, and confidence was the backbone of trade. The return to the Gold Standard and the raising of the ban upon foreign loans were also of assistance. Many of our purchasers required a loan before they could buy our goods. The subject of foreign competition was one on which employers and workers should co-operate to combat, for both were equally affected by it. In conclusion, the Chairman paid a tribute to the zeal and interest manifested by the staff. The report and accounts were adopted.

Mr. A. F. BERRY (Vice-Chairman) moved that the Chairman be granted £5,000 in recognition of his exceptional services, stating that his work had been enormous. Mr. Spencer, he said, had become actually obsessed with the company's affairs, and this was but a small tribute to his energies. Mr. JOHN CROSS (director) seconded the resolution, which was carried unanimously. Mr. SPENCER briefly acknowledged his thanks. The retiring directors, Messrs. Berry and Cross, and the auditors, Messrs. Broads, Paterson & Co., were re-elected.

At the subsequent extraordinary meeting resolutions were approved for dividing the unissued £1 shares into five shares of 4s. each; and for altering the Articles of Association. The meeting concluded with a vote of thanks to the Chairman.

Latest Time for receiving, 5 p.m. Tuesday.

METROPOLITAN BOROUGH OF SHOREDITCH.

Electricity Department.

TENDERS are invited for the supply, delivery, and erection of the following plant, to be installed at the Council's Electric Generating Station, Whiston Street, Haggerston, *via.*:—

(a) One 50,000 lb. Water Tube Boiler, complete with Economiser, forced and induced draught, &c.
(b) One 10,000-kW Turbo Generator, complete with Condenser, pumps, &c.

Specifications and forms of tender will be issued on the 4th January, 1926, and may be had upon application to the undersigned on payment of a deposit of one guinea, which will be returned on receipt of a *bona-fide* tender.

Tenders enclosed in a sealed envelope endorsed "Tender for Boiler Plant" or "Tender for Generating Plant," as the case may be, and addressed to the Chairman and Members, Electricity Committee, must be delivered at the offices of the Electricity Supply Department, Coronet Street, Shoreditch, N.1, not later than noon on Wednesday, January 27th, 1926.

Only tenders from British firms will be considered.

The Council do not bind themselves to accept the lowest or any tender.

W. WEEKES,
Borough Electrical Engineer.

N.C.S. RELAYS

Overload Relay with adjustable definite time limit.

As members of the B.E.A.M.A. we stand for high qnality of product with a fair deal to our customers

Supersensitive Fawssett Parry Relay for Mains Protection.

No matter for what purpose you require a Relay, there is a N.C.S. Relay that will suit your requirement. We have specialised in their manufacture, and we are able to offer you an instrument that is reliable and efficient.

WE MAKE:

Overload Clockwork Relays with adjustable definite time limit.

Overload Relays for instantaneous operation.

Reverse Current and Reverse Power Relays.

Overload Induction Relay with adjustable inverse time limit.

Leakage Relays.

Supersensitive Fawssett Parry Relay for Mains Protection.

Can be fitted with Inertia device giving inverse time action.

All other forms of Relay required in connection with the protection of Alternating and Direct Current Circuits.

Various Relay combinations can be housed in one case.

Write us to-day for full particulars and prices.

BRITISH INSTRUMENTS FOR BRITISH INDUSTRIES.

Write for our Booklet,

"The Weir Turbo-Feed Pump."

The Weir Turbo-Feed Pump

For the up-to-date Power Plant.

Hundreds of the leading power stations at home and abroad have adopted the Weir Turbo-Feed Pump—a tribute to its Efficiency, its Reliability and its Economy.

The Pump is suitable for the highest steam pressures and superheat, is entirely automatic in action, noiseless when running, steady in discharge, and gives freedom from shocks to pipes and valves; the exhaust is free from oil.

Of Sound Mechanical Construction, this pump is compact in design, occupies small floor space, and is easily accessible. Standard sizes. Prompt delivery.

'ELLISON' CONTROL GEAR

for 6,600 VOLT MOTORS

The illustration shows a 6,600 volt three-phase Ellison motor starting unit, comprising an automatic circuit breaker for the stator, interlocked with an oil rotor starter.

This Ellison stator control pillar is the simplest piece of protective switchgear yet devised : an automatic oil-break circuit breaker under a steel frame cubicle containing the terminals, busbars, ammeter and isolating device.

The pillar occupies little floor space and its use ensures safety and reliability. The breaker is made to drop down instead of to draw out. It is mistake-proof in operation, and one "free" handle suffices to close and to open the breaker. The isolators are withdrawn and the oil tank lowered by turning a handle which is completely interlocked with the closing mechanism. The overload trip coils are oil-immersed and series wound.

The Rotor Starter is of course the well-known oil cooled Ellison standard with roller contacts at the bottom of the oil tank, a practically indestructible metallic resistance, and slow motion operating mechanism.

The complete unit is safe in non-technical hands.

"Ellison" Rotor and Stator control gear for slip-ring Induction Motors is *standardized in three types up to 660, 3,300 and 6,600 volts.*

The Universal Adoption of SIMPLEX CONDUIT

demonstrates beyond dispute its high commercial value, by its selection, on a quality basis, for important work throughout the World in every description of electrical installation.

There is no doubting the existence of a difference between Simplex and other conduit, and also similarly no doubting that this difference tells wholly in favour of the former.

But claims alone are ultimately of little use. Claims for other conduit may be large and justifiable, and for Simplex larger and still justifiable. Rather than by these, however, Simplex Conduit is confidently recommended by its performance.

New Conduit Price Schedule No. 1102 on request.

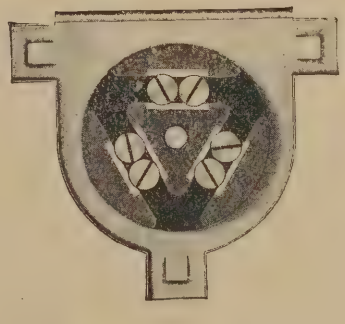
The "Super" Box

saves the time and temper of the wireman

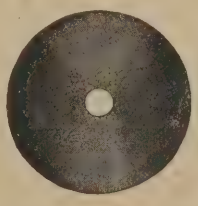
The "Super" Box is the most efficient wiring system box produced. It has no loose screws or nuts, requires no special tools for fixing, cannot possibly be fitted up incorrectly, *and makes a perfect automatic bond.* The cover is held in position by one unloseable self-centreing screw. Efficient bonding is automatically produced, and there is no subsequent loosening by vibration.



The "Super" Box looks a good box, and it is a good box.

Use it in conjunction with the

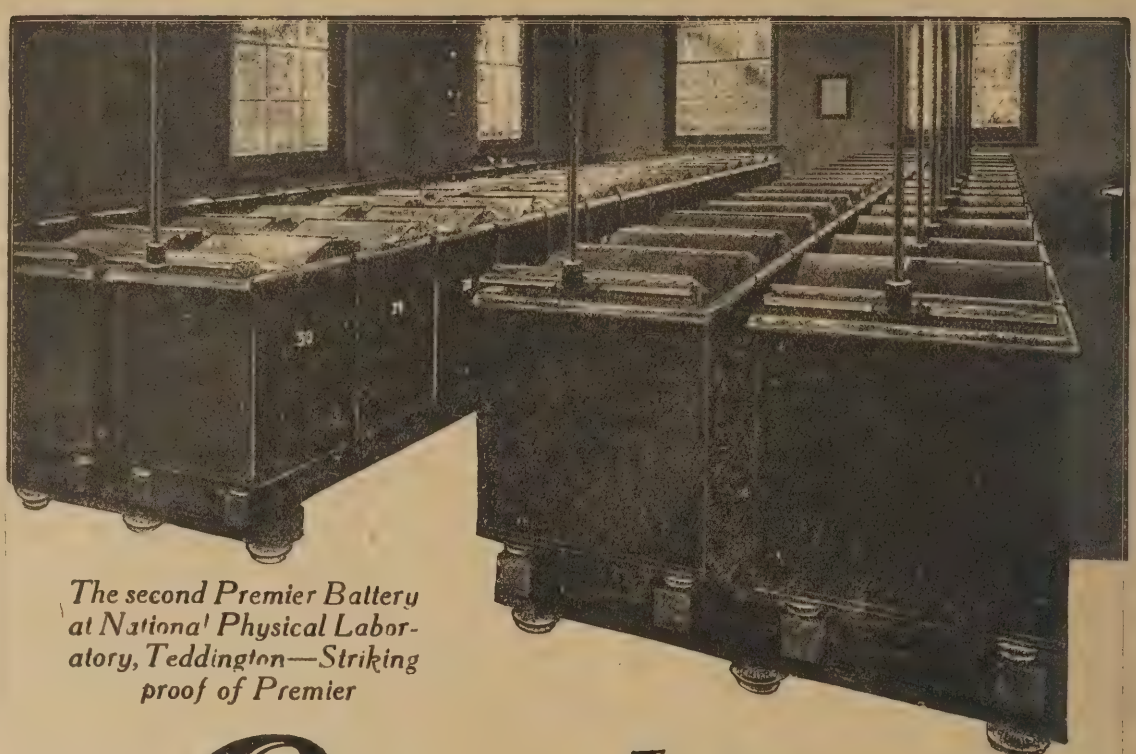
HENLEY Wiring System



Lid of box, which has unloseable screw permanently attached. The screw is the only thing necessary for closing down the box and bonding the sheathing of the H.W.S. wires.

Base of box, with special insulator holding brass terminals.

W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, London, E.C.1.



Examine its good points at your leisure.

Insulating cover for insulator.

Write for a free sample, enclosing your trade or business card.

PREMIER

The second Premier Battery at National Physical Laboratory, Teddington—Striking proof of Premier

Quality

Premier Accumulator Installations are giving complete satisfaction to Governments, Public Bodies, Corporations, Railway Companies because the principle and details of their construction are founded on the best practice of the past 25 years. The celebrated laboratories of Planté and Faure furnished the original maker of Premier Batteries with the experience which is constantly improving the quality to-day.

STORAGE BATTERIES

Dependability

A Storage Battery fails in its usefulness in life if it is not dependable—if it cannot be relied upon to be always ready to perform its allotted task. Whether the battery be for a stand-by or for carrying the peak load at a Power Station, for country house lighting, for telephone operation, or any of the many other uses of storage batteries, failure at critical moments cannot be tolerated.

Dependable batteries have been made for many years by the members of the Accumulator Makers Association—dependable productions of dependable manufacturers.

Members of the Accumulator Makers Association:—

The Chloride Electrical Storage Co., Ltd., Clifton Junction :: :: near Manchester.

The D.P. Battery Co., Ltd., Bakewell :: Derbyshire.

Hart Accumulator Co., Ltd., Marshgate Lane, Stratford, E. 15.

The Premier Accumulator Co. (1921) Ltd., Cattle Market Road :: :: Northampton

Pritchett & Gold & E.P.S. Co., Ltd., 50, Grosvenor Gardens, Victoria, S.W. 1.

Cheap Cables

By "cheapness" we sometimes denote articles that, irrespective of their value, are of low cost, but by a thing that is really cheap or perhaps, more correctly, "inexpensive," we mean an article that despite its first cost, by reason of the value it offers, in the long run shows a very small charge measured by service years.

HELSBY

CABLES

on account of the meticulous care exercised in their manufacture and testing can reasonably be claimed to be the least costly.

British Insulated & Helsby Cables, Ltd.,

Cablemakers and Electrical Engineers,

HELSBY near WARRINGTON.

A message from The House of GRAHAM

To the Radio Trade of Britain on the eve of another Wireless Christmas

The festive Season presents an opportunity for the House of Graham to offer Best Wishes for a Happy Christmas and prosperity in the New Year.

In the past the House of Graham has used every endeavour to justify the confidence of thousands of Radio enthusiasts throughout the land, and in the future the same policy of supplying products of outstanding quality and efficiency, at strictly moderate prices, will be followed.

Backed by generous "Service" in the full sense of the expression, the AMPLION is indeed synonymous with

BETTER RADIO REPRODUCTION.

IMPROVED

Feeder Pillar Casings.

N.B.

Please give us your enquiries for odd sizes whether taller or shorter or

N.B.

with divided up interiors, &c., &c., also for Doors and Frames for Brick Chambers.

No. 1326. Registered Design.

We have brought out this excellent Feeder Pillar in the **seventeen** standard sizes as set out below in order to meet all ordinary requirements.

These Casings are of very nice appearance, are made up of thoroughly good castings, and are very efficiently ventilated. Each Pillar is provided with doors, hung on massive ornate malleable iron hinges pivotted on $\frac{3}{8}$ in. dia. Brass Pins, and each door is fitted with a good Brass Lock. Sizes up to and including Size 4 have their door openings closed in by single doors, the openings in the larger sizes being closed in with multiple doors. The underground root part of all sizes measures 15 inches high and can be made detachable at a reasonable extra.

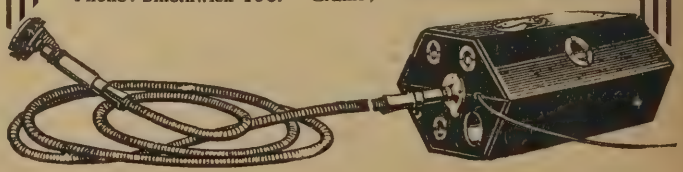
—AFTER THE OTHER SCALING (?) TOOLS HAD REMOVED ALL SCALE POSSIBLE—

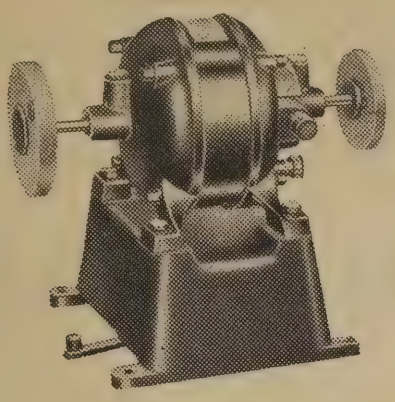
The "SKATOSKALO" removed yet another 61 lbs. of hard scale from the SAME Tubes.

A large Firm in the North of England recently tried scaling their Boilers with a so-called Scaling Tool. It removed 91 lbs. of scale, and as no more scale was forthcoming the tubes were pronounced clean.



But there was a doubt — so the "Skatoskalo" was employed and removed

a further 61 lbs. of scale from those so-called clean (?) tubes.



You may *think* you scale your tubes thoroughly with ordinary scaling appliances until you start the "Skatoskalo" on the job — *THEN YOU KNOW!*

Sales Manager: R. A. MARPLES.

Telegrams: "Autosynero, Fleet, London."
Telephone: Holborn 1703.

They Develop Heavy Starting Torque

The heavy starting torque developed by Century Repulsion-Start Induction Single Phase Motors renders them especially desirable for the operation of refrigerating machines, crushers, mixers, pumps, heat regulators, sewerage disposal equipment, garage air compressors and also other similar apparatus usually employing automatic or remote control.

The low starting current requirements of this motor—not in excess of 245 per cent. of full load current—permits the use of any standard single throw switch for starting. A fuse which will protect the motor while running and carrying its load, is usually of ample capacity for starting due to the low starting current and quick acceleration.

The new Century Wool-yarn System of Lubrication can now be furnished in all Century R S Motors of fractional horse power sizes.

Built in all standard sizes from 1/8 to 40 horse power—temperature rise not more than 40 deg. Centigrade.

Send for Bulletin No. 29.

Bulletin No. 29 describes all superior features of Century Repulsion-Start Induction Single Phase Motors—a copy will be mailed to you on request.

CENTURY ELECTRIC COMPANY

1806, Pine Street, St. Louis, Mo.

29 Stock Points in the United States and more than 50 Outside Thereof.

1/8 to 40 H.P.

Century MOTORS

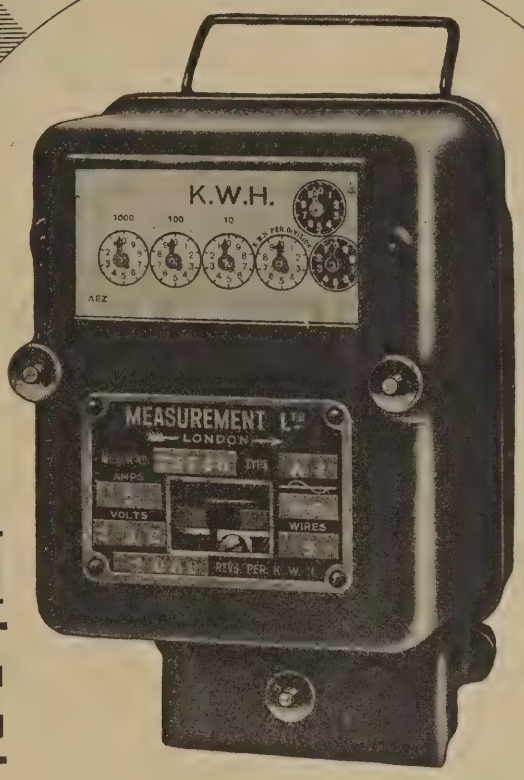
1/8 to 40 H.P.

The Macintosh System Sells Electricity.

Its simplicity is so easily explained, and its invisibility so simply demonstrated, that the prejudiced objections to installing electricity vanish as smoke. The neatness of the narrow wooden covering over the "MACONITE" wires makes instant appeal.

The *Macintosh* (Patented) SURFACE WIRING SYSTEM

is, moreover, particularly attractive to the Contractor. It is simple to install, requiring no earthing or bonding. It is profitable. It creates instant satisfaction on the part of the customer. It complies with the I.E.E. Rules.



Send for copies of "An Achievement," the booklet of the System, and for Samples and Prices.

MEASUREMENT

BRITISH HOUSE SERVICE METERS

(APPROVED BY THE ELECTRICITY COMMISSIONERS.)

The use of **INFERIOR METERS** is **VERY EXPENSIVE,**

BUT

The use of **METERS** which are both **INFERIOR** and **EXPENSIVE** is **DISASTROUS.**

You cannot secure a **GOOD ARTICLE** merely by **PAYING A HIGH PRICE.**

But, for a **MODERATE PRICE,** you can obtain a **"MEASUREMENT" METER** which is **UNSURPASSED FOR ACCURACY AND RELIABILITY,** while, by its adoption, **MAINTENANCE CHARGES ARE REDUCED TO A MINIMUM.**

MEASUREMENT LIMITED,

34/38, PROVOST STREET, CITY ROAD, LONDON, N.1.

Temporary Offices: 118, CITY ROAD, LONDON, E.C.1.

Telephone No.: CLERKENWELL 3157. **Telegrams: "SUPERMETER (FINSQUARE) LONDON."**

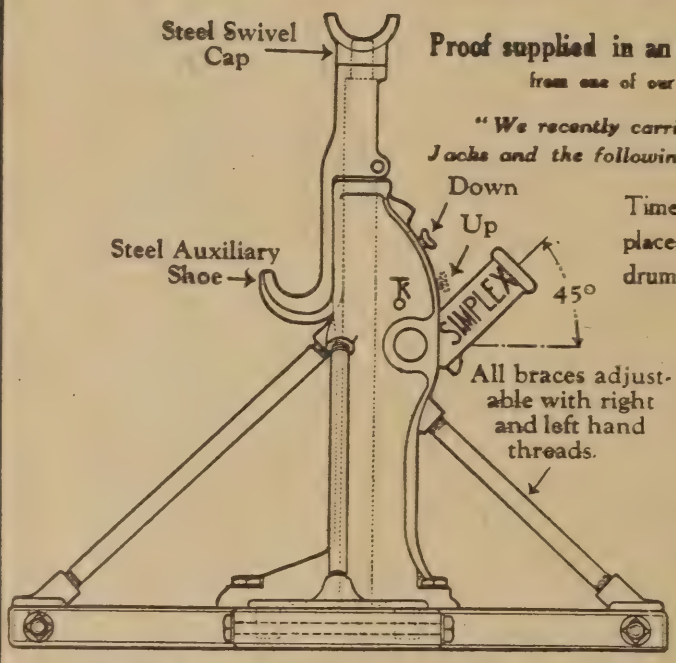
ELECTRICAL PORCELAINS

bearing this mark →

are made of the best materials, carefully prepared and manipulated by experienced workers operating under expert supervision.

"There are none better."

The mark of
MACINTYRE



is the mark of
EXCELLENCE.

The Best **CABLE DRUM JACK** is the

SIMPLEX No. 322

Proof supplied in an unsolicited testimonial
from one of our users who says:—

"We recently carried out a test on Simplex Jacks and the following result was proved":—

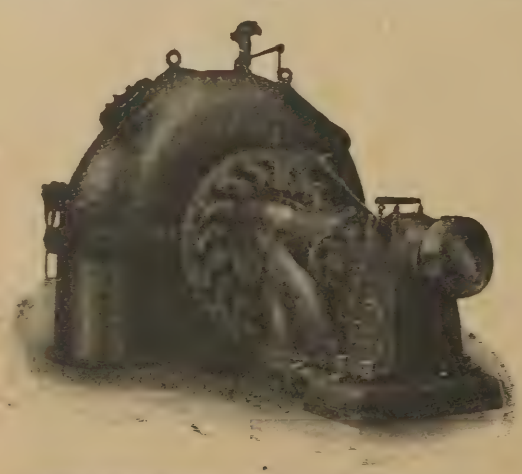
Time taken to lift jacks off cart, placed in position and lift cable drum clear of the ground.

Simplex No. 322 - -	**45 seconds.**
Ordinary slow screw jack -	2 minutes.

No. 322 Simplex Cable Drum Jack.

The most efficient tool for producing the maximum Man power. Safety—Capacity and sound construction.
Specially designed for Cable Drums of 36 in. to 84 in. diameter.
Raise on Cap from 29 in. to 43 in. Raise on Shoe from 17 in. to 31 in.
Can be shipped in parts and easily reassembled.

We would be willing to let you have for a free trial 2 of these jacks (right and left hand) for a period of 2 months to test our claims for yourself, as we are confident we shall receive the order for not only the 2 but many more.



FULL PARTICULARS UPON APPLICATION.

NEWBRIDGE

ELECTRIC TIME SWITCHES.

For Shop-Window Lighting Control.

When window lights are controlled by a Newbridge Time Switch, the window can be left illuminated until any desired time.
A simple "ON" and "OFF" model for this purpose is shown herewith. It only requires winding once weekly or fortnightly as desired.

British Made & Fully Guaranteed.

Send NOW for our Shop-Window Lighting Leaflet.

Type A/2—5 amp. **8-day Run.**

Sole Makers:—

THE HORSTMANN GEAR COMPANY, LTD.,
NEWBRIDGE WORKS - - BATH.

CLASSIFIED INDEX OF ADVERTISEMENTS.

The names of Advertisers whose Announcements are ordered for a series are entered under any one Heading in this Index Free of Charge, but if repeated under existing headings **1s.** per Week is charged for each additional entry.

General and Electrical Engineers and Boiler Makers.

PATENT "CRACKER" TYPE.

RESISTANCE UNITS

SPECIAL ADVANTAGES:

1.—Very large radiating surface for a given capacity.
2.—Small weight for a given capacity.
3.—Absolute freedom for expansion.
4.—Owing to the large surface and small bulk of metal they cool very quickly.
5.—They are absolutely unaffected by vibration or jolts.
6.—Units can be run red hot without danger of sagging.
7.—Repairs can be effected on separate units.
8.—Tappings can be taken off anywhere along the centre clamp.
9.—The number of units being small compared with a grid resistance of equal capacity, there are not many joints to cause trouble.

Full Particulars and Prices on Application.

The jury . . . . added a rider . . .

Their verdict was one of "Misadventure." The Coroner had elicited that "the identical hand-lamp had been in constant use for some time previously without complaint." Shock-proof? "Well, reasonably so, under normal conditions and providing the earth-wire connection was intact." But on this particular occasion it wasn't, hence the rider. Hence the importance of making sure your hand-lamps have the trade mark "J.C.W." embossed thereon. It stands for safety—first, last and always.

Non-hygroscopic, non-softening insulation. Corrosion and shock-proof. No earth wires, no inquests. Meet the recommendations of the Electrical Inspector of Factories and fully comply with Home Office regulations.

A range of eight patterns offers safe service for every normal or abnormal situation. Fully illustrated and detailed list post free.

TRADE MARK.

L.P.S.
ENAMELLED COPPER WIRE

The Wire that can be depended on

L.P.S. Enamelled Wire is distinguished from among all its fellows by reason of its great consistency of insulation and perfect reeling. It has long been recognised by discriminating users of experience to be the finest and most reliable Enamelled Insulated Wire extant.

The weekly output of L.P.S. Enamelled Wire is incomparably greater than that of any other Enamelled Wire on the market, which explains the low price at which it is marketed and the scrupulous observance of delivery promises.

20,000

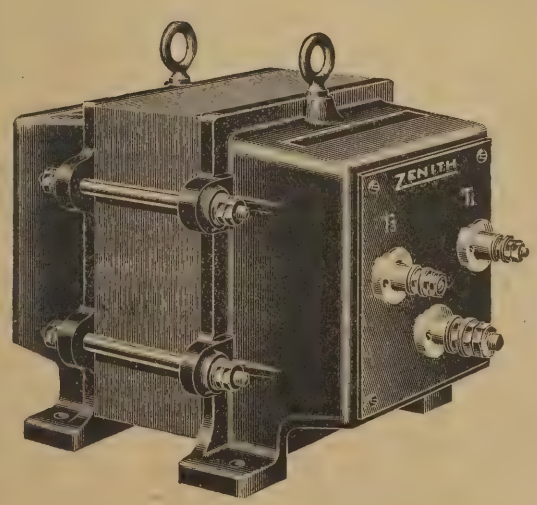
"ADNIL" PRESS BUTTON SWITCHES

already supplied for Housing Schemes

IN ONE DISTRICT ALONE

5 AMPS., 250 VOLTS. Supplied in Single Pole, one- and two-way. Also switch and combined wall plug, Suspension Switch, one- and two-way.

THE ALL-INSULATED **"ADNIL" PRESS BUTTON SWITCH** is made from the unbreakable insulating material, "Ebolite." Having no fragile porcelain parts, it is very rapidly gaining in popularity. It is operated by a slight finger pressure either "ON" or "OFF." Moreover, it is easily and quickly wired, positive in action and makes a quick break. Lastly, it is light in weight, handsome in appearance and remains unaffected by heat or chemicals.



Write for list N.S. 3al25.

A Valuable Booklet for Power Users.

AS its title implies, this booklet indicates the way to cheaper power, not by mere general statements but by authoritative figures.

It gives full details of the relative running costs of Electric Motors, Gas, Petrol and Paraffin Engines, and compares them with the cost of generating equivalent power by means of a Gardner Heavy Oil Engine.

The difference is so great that no power user can afford to ignore the possibilities of Oil Power. Send for this booklet and use the figures as a basis of investigation.

Nine Horizontal Cold Start Models. 12 to 82 B.H.P

GARDNER HEAVY OIL ENGINES.

Please mention this journal when writing.

INSULATION UNDAMAGED

Next to high dielectric strength, there is possibly no more outstanding "ELO" characteristic than "heat resistance."

The ordinary grades will withstand 250° F., and special grades can be subjected to temperatures up to 400° F. without damage.

400° Wherever insulation is subject to great heat there is no material to equal "ELO."

Synthetic Resin Products.

The principal forms in which "ELO" is made are Finished Mouldings, Varnish, Resin and Moulding Powders. All have the same valuable characteristics.

Further particulars of these will be sent on request.

The

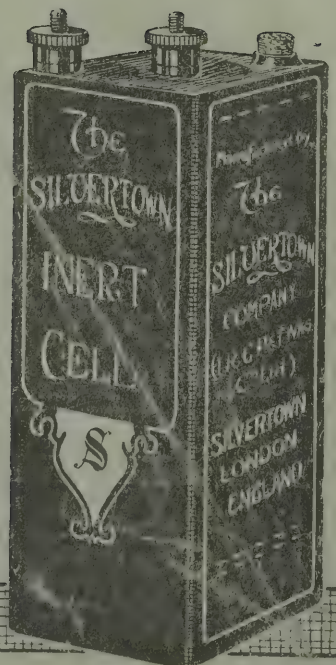
Silvertown



Inert Cell

remains inactive until water is added, after the absorption of which it becomes practically a dry cell.

The great advantage it possesses is that it can be kept in stock indefinitely without deterioration.

For this reason the Inert Cell is particularly suitable for use abroad, in places where dry cells are affected by the climate.

We make all types of Primary Batteries. Write for List No. 31.
